## FCC §15.247 (i) & §2.1091- MAXIMUM PERMISSIBLE EXPOSURE (MPE)

## **Applicable Standard**

According to subpart 15.247 (i) and subpart 2.1091 systems operating under the provisions of this section shall be operated in a manner that ensures the public is not exposed to RF energy level in excess of the communication guidelines.

Limits for General Population/Uncontrolled Exposure

Report No.: SZ4210401-09429E-RF

| Limits for General Population/Uncontrolled Exposure |                                     |                                     |                                     |                                |  |  |  |  |  |
|---|-------------------------------------|-------------------------------------|-------------------------------------|--------------------------------|--|--|--|--|--|
| Frequency<br>Range<br>(MHz)                         | Electric Field<br>Strength<br>(V/m) | Magnetic Field<br>Strength<br>(A/m) | Power Density (mW/cm <sup>2</sup> ) | Averaging<br>Time<br>(Minutes) |  |  |  |  |  |
| 0.3-1.34  | 614                                 | 1.63                                | *(100)                              | 30                             |  |  |  |  |  |
| 1.34-30   | 824/f                               | 2.19/f                              | $*(180/f^2)$                        | 30                             |  |  |  |  |  |
| 30-300  | 27.5                                | 0.073                               | 0.2                                 | 30                             |  |  |  |  |  |
| 300-1500  | /                                   | /                                   | f/1500                              | 30                             |  |  |  |  |  |
| 1500-100,000  | /                                   | /                                   | 1.0                                 | 30                             |  |  |  |  |  |

f = frequency in MHz

\* = Plane-wave equivalent power density

## Result

## **Calculated Formulary:**

Predication of MPE limit at a given distance

$$S = \frac{PG}{4\pi R^2}$$

S = power density (in appropriate units, e.g. mW/cm2)

P = power input to the antenna (in appropriate units, e.g., mW).

G = power gain of the antenna in the direction of interest relative to an isotropic radiator, the power gain factor, is normally numeric gain.

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm)

| Frequency<br>(MHz) | Antenna Gain |           | Tune up conducted power |       | Evaluation<br>Distance | Power<br>Density | MPE Limit             |
|--------------------|--------------|-----------|-------------------------|-------|------------------------|------------------|-----------------------|
|                    | (dBi)        | (numeric) | (dBm)                   | (mW)  | (cm)                   | $(mW/cm^2)$      | (mW/cm <sup>2</sup> ) |
| 2412-2472          | 2.0          | 1.58      | 17.0                    | 50.12 | 20                     | 0.016            | 1                     |

Note: 1. The tune up conducted power was declared by the applicant

To maintain compliance with the FCC's RF exposure guidelines, place the equipment at least 20cm from nearby persons.

**Result: Pass**
