# 1 General Information

## 1.1 Client Information

Applicant:	Shenzhen VanTop Technology & Innovation Co., Ltd.
Address:	506, BLDG 4, Pingshan minQi Technology Park, No. 65 Lishan Road, Pingshan Community, Taoyuan Street, Nanshan District, Shenzhen, China
Manufacturer:	Shenzhen VanTop Technology & Innovation Co., Ltd.
Address:	506, BLDG 4, Pingshan minQi Technology Park, No. 65 Lishan Road, Pingshan Community, Taoyuan Street, Nanshan District, Shenzhen, China

## 1.2 Product Description of EUT

The EUT is REMOTE that contains a 2.4G SRD radio, this report covers the full testing of the 2.4G SRD radio.

Test Model	DR-ST130B
Multiple Models	DR-ATM11B
Sample Serial Number	74-2 for RE test (assigned by WATC)
Sample Received Date	2024-3-28
Sample Status	Good Condition
Frequency Range	2420-2460MHz
Maximum E-field Strength:	100.19dBuV/m@3m
Modulation Technology	GFSK
Antenna Gain <sup>#</sup>	0dBi
Spatial Streams <sup>#</sup>	SI (1TX)
Power Supply	DC 4.5V from battery
Operating temperature <sup>#</sup>	0 deg.C to +40 deg.C
Adapter Information	N/A
Modification	Sample No Modification by the test lab

## 1.3 Antenna information

<b>15.203 requirement:</b>	
An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.	
<b>Device Antenna information:</b>	
The antenna is an internal antenna which cannot replace by end-user. Please see product internal photos for details.	

## 1.4 Related Submittal(s)/Grant(s)

No Related Submittal(s)/Grant(s)
----------------------------------

## 1.5 Measurement Uncertainty

Parameter	Expanded Uncertainty (Confidence of 95%(U = 2Uc(y)))	
AC Power Lines Conducted Emissions	±3.14dB	
Emissions, Radiated	Below 30MHz	±2.78dB
	Below 1GHz	±4.84dB
	Above 1GHz	±5.44dB
Bandwidth	0.34%	

**Note 1:** The extended uncertainty given in this report is obtained by combining the standard uncertainty times the coverage factor K with the 95% confidence interval. Otherwise required by the applicant or Product Regulations, Decision Rule in this report did not consider the uncertainty.

**Note 2:** The Decision Rule is based on simple acceptance with ISO Guide 98-4:2012 Clause 8.2 (Measurement uncertainty is not taken into account when stating conformity with a specified requirement.)

## 1.6 Laboratory Location

## 1.7 Test Methodology

FCC CFR 47 Part 2  
 FCC CFR 47 Part 15  
 ANSI C63.10-2013

## 2 Description of Measurement

### 2.1 Test Configuration

Operating channels:					
Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)
1	2420	2	2440	3	2460
According to ANSI C63.10-2013 chapter 5.6.1 Table 11 requirement, select lowest/middle/highest frequency in the frequency range in which device operates for testing. The detailed frequency points are as follows:					
Lowest channel		Middle channel		Highest channel	
Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)
1	2420	2	2440	3	2460

Test Mode:			
Transmitting mode:	Keep the EUT in continuous transmitting with modulation		
Exercise software <sup>#</sup> :	Engineering mode, EUT was configured to test mode by manufacturer		
Mode	Power Level Setting <sup>#</sup>		
	Low Channel	Middle Channel	High Channel
SRD	Default	Default	Default
The exercise software and the maximum power setting that provided by manufacturer.			

Worst-Case Configuration:
For radiated emissions, EUT was investigated in three orthogonal orientation, the worst-case orientation was recorded in report
For radiated emission 9kHz-30MHz and above 18GHz were performed with the EUT transmits at the channel with highest output power as worst-case scenario.

### 2.2 Test Auxiliary Equipment

Manufacturer	Description	Model	Serial Number
/	/	/	/

## 2.3 Test Setup

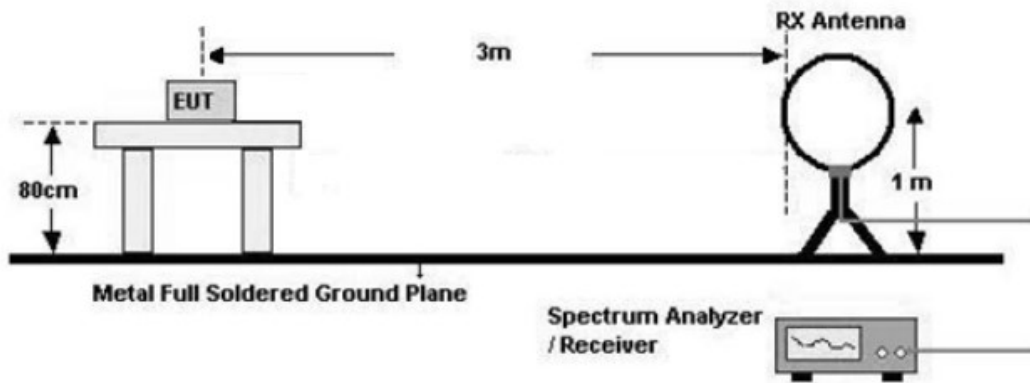

### 1) Conducted emission measurement:

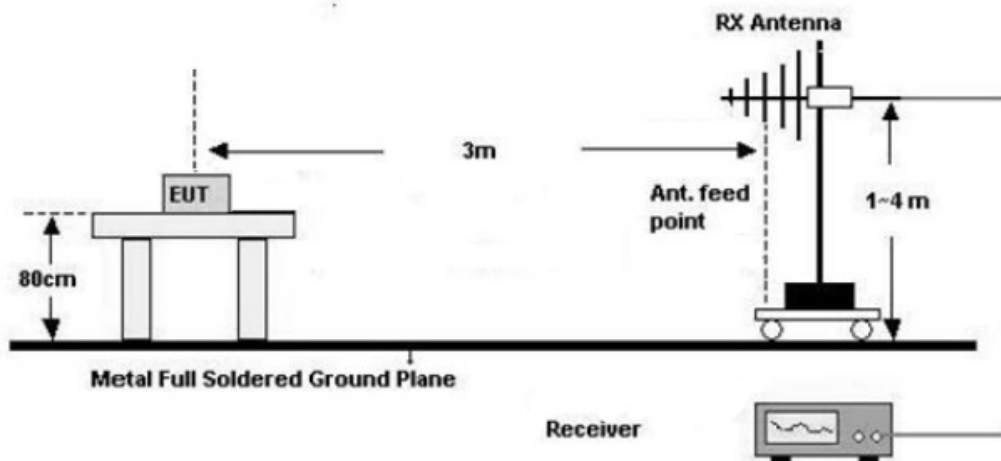

**Note:** The 0.8 m distance specified between EUT/AE/PSU and AMN/AAN, is applicable only to the EUT being measured. If the device is AE then it shall be >0.8 m.

### 2) Radiated emission measurement:

Below 30MHz (3m SAC)

30MHz-1GHz (3m SAC)

## 2.4 Test Procedure

### Conducted emission:

1. The E.U.T is placed on a non-conducting table 40cm from the vertical ground plane and 80cm above the horizontal ground plane (Please refer to the block diagram of the test setup and photographs).
2. Both sides of A.C. line are checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.10 on conducted measurement.
3. Line conducted data is recorded for both Line and Neutral

**Radiated Emission Procedure:**

**a) For below 30MHz**

1. All measurements were made at a test distance of 3 m. The measured data was extrapolated from the test distance (3m) to the specification distance (300 m from 9-490 kHz and 30 m from 490 kHz- 30 MHz) to clearly show the relative levels of fundamental and spurious emissions and demonstrate compliance with the requirement that the level of any spurious emissions be below the level of the intentionally transmitted signal. The extrapolation factor for the limits were  $40 \cdot \log(\text{test distance} / \text{specification distance})$ .
2. Loop antenna use, investigation was done on the three antenna orientations (parallel, perpendicular, ground-parallel)

**b) For 30MHz-1GHz:**

1. The EUT was placed on the tabletop of a rotating table 0.8 m the ground at a 3 m semi anechoic chamber. The measurement distance from the EUT to the receiving antenna is 3 m.
2. EUT works in each mode of operation that needs to be tested. The highest signal levels relative to the limit shall be determined by rotating the EUT from  $0^\circ$  to  $360^\circ$  and with varying the measurement antenna height between 1 m and 4 m in vertical and horizontal polarizations.

**c) For above 1GHz:**

1. The EUT was placed on the tabletop of a rotating table 1.5 m the ground at a 3 m fully anechoic room. The measurement distance from the EUT to the receiving antenna is 3 m (1-18GHz) and 1.5 m (above 18GHz).
2. EUT works in each mode of operation that needs to be tested, and having the EUT continuously working. The highest signal levels relative to the limit shall be determined by rotating the EUT from  $0^\circ$  to  $360^\circ$  and with varying the measurement antenna height between 1 m and 4 m in vertical and horizontal polarizations.
3. Open the test software to control the test antenna and test turntable. Perform the test, save the test results, and export the test data.
4. Base on FCC 15.31 (f) (2): measurements may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurements in the near field.

**Bandwidth Test:**

1. The antenna port of EUT was connected to the RF port of the Spectrum analyzer through Attenuator and RF cable.
2. The EUT is keeping in continuous transmission mode.
3. Test the bandwidth and record the result

Remark:

Corrected Amplitude= Reading level + corrected Factor

Corrected Factor = Antenna factor + Cable loss – Amplifier gain

Margin = Corrected Amplitude – Limit

The emission levels of other frequencies that were lower than the limit 20dB not show in test report.

For emissions in 18GHz-25GHz range, all emissions were investigated and in the noise floor level.

Remark:

Average Amplitude= Peak level + Duty Cycle Factor

Margin= Average Amplitude - Limit

Duty Cycle= Ton/Tp=0.810/8.059=10.05%

Duty Cycle Factor=20\*log(Duty Cycle)=-19.96
