### 骨传导原理

我们听到的大部分声音, 都是声波经过空气到达耳膜, 然后声波使耳膜发生震动进而将声音传至内耳道;

另一种方式是, 声波通过骨头震动直接传至内耳道而不经过耳膜, 这也是人们听到自己声音的一种方式, 这种声音的传播方式就是骨传导。

### Principles of bone conduction

Most of the sound we hear is the result of sound waves passing through our eardrum to make it vibrate so that the sound waves can be conducted to the internal auditory canal.

The other way is that the sound waves are directly conducted to the internal auditory canal through the vibration of the bone instead of eardrum. This is another way of people hearing their own sound and this sound conduction is called bone conduction.
