Report on the FCC and IC Testing of:

PervasID UHF RFID Distributed Antenna System, Model: Space/Portal Ranger 9200

In accordance with FCC 47 CFR Part 15C, Industry Canada RSS-247 and Industry Canada RSS-GEN

Prepared for: PervasID St John's Inovation Centre, Cowley Road, Cambridge, CB4 OWS, UNITED KINGDOM

FCC ID: 2AQQW9200 IC: 24482-9200

Signatures in this approval box have checked this document in line with the requirements of TÜV SÜD Product Service document control rules.

ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15Cand Industry Canada RSS-247 and Industry Canada RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

EXECUTIVE SUMMARY

A sample of this product was tested and found to be compliant with FCC 47 CFR Part 15C: 2017, Industry Canada RSS-247: Issue 2 (2017-02) and Industry Canada RSS-GEN: Issue 4 (2014-11).

1.5 **Product Information**

1.5.1 Technical Description

UHF RFID Distributed Antenna System - intended use detection and monitoring of UHF RFID tags.

1.6 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

1.7 EUT Modification Record

The table below details modifications made to the EUT during the test programme. The modifications incorporated during each test are recorded on the appropriate test pages.

| Modification State | Description of Modification still fitted to EUT | cription of Modification still fitted to EUT Modification Fitted By | | | | | |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|-------------------|--|--|--|--|

Figure 6 - Hopping 927.25 MHz - Measured Frequency 928.00 MHz

FCC 47 CFR Part 15, Limit Clause 15.247 (d)

20 dB below the fundamental measured in a 100 kHz bandwidth using a peak detector. If the transmitter complies with the conducted power limits, based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB below the fundamental instead of 20 dB.

Industry Canada RSS-247, Limit Clause 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section 5.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

2.2.7 Test Location and Test Equipment Used

This test was carried out in RF Laboratory 1.

2.3 Spurious Radiated Emissions

2.3.1 Specification Reference

FCC 47 CFR Part 15C, Clause 15.247 (d) and 15.205 Industry Canada RSS-247, Clause 5.5 Industry Canada RSS-GEN, Clause 6.13

2.3.2 Equipment Under Test and Modification State

Space/Portal Ranger 9200, S/N: 0280420101-0001 - Modification State 0 (1 GHz to 10 GHz) Space/Portal Ranger 9200, S/N: 0280420101-0007- Modification State 1 (30 MHz to 1 GHz)

2.3.3 Date of Test

30-July-2018 to 09-September-2018

2.3.4 Test Method

This test was performed in accordance with ANSI C63.10-2013 clause 6.3, 6.5 and 6.6. For frequencies > 1 GHz, plots for average measurements were taken in accordance with ANSI C63.10 clause 4.1.4.2.3 to characterize the EUT. Where emissions were detected, final average measurements were taken in accordance with ANSI C63.10 clause 4.1.4.2.2.

The plots shown are the characterization of the EUT. The limits on the plots represent the most stringent case for restricted bands, (74/54 dBuV/m) when compared to 20 dBc outside restricted bands. The limits shown have been used as a threshold to determine where further measurements are necessary. Where results are within 10 dB of the limits shown on the plots, further investigation was carried out and reported in results tables.

The following conversion can be applied to convert from $dB\mu V/m$ to $\mu V/m$: 10⁽Field Strength in $dB\mu V/m/20$).

2.3.5 Environmental Conditions

| Ambient Temperature | 21.5 -22.0 °C |

FCC 47 CFR Part 15, Limit Clause 15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in 15.209(a)

Industry Canada RSS-247, Limit Clause 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section 5.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

2.3.7 Test Location and Test Equipment Used

This test was carried out in EMC Chamber 5.

Space/Portal Ranger 9200, S/N: 0280420101-0001 - Modification State 0

2.4.3 Date of Test

13-August-2018

2.4.4 Test Method

This test was performed in accordance with ANSI C63.10, clause 7.8.5 using a peak power meter.

The conducted power measurements were made at the maximum power setting (340) based on the minimum cable length of 11.5m that is to be used at this power setting for cable type 'LMR195'. When installed the power setting used in device is configured to consider the loss between the conducted antenna port and the antenna and the gain of the transmitting antenna.

The EIRP was calculated by adding the antenna gain of 6.49 dB which was the highest declared antenna gain for antenna type 'Laird S9028PCR'. The eight beams are fed in to two 4-element array ceiling tile antennas of which the transmitted beams are non-overlapping, therefore the power from each individual antenna ports were not summed and each beam is allowed to transmit a maximum of 4 W EIRP.

Table 30 - EIRP

FCC 47 CFR Part 15, Limit Clause 15.247 (b)(3)(4)

For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt.

The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Industry Canada RSS-247, Limit Clause 5.4 (a)

For FHSs operating in the band 902-928 MHz, the maximum peak conducted output power shall not exceed 1.0 W, and the e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels; the maximum peak conducted output power shall not exceed 0.25 W and the e.i.r.p. shall not exceed 1 W if the hopset uses less than 50 hopping channels.

2.4.7 Test Location and Test Equipment Used

This test was carried out in RF Laboratory 1.

2.5.3 Date of Test

03-July-2018 to 14-August-2018

2.5.4 Test Method

This test was performed in accordance with ANSI C63.10, clause 6.7 and 7.8.8.

Radiated Spurious Emissions were performed with the antenna in the frequency range 30 MHz to 1 GHz, therefore restricted band measurements were not considered for conducted measurements below 1 GHz.

Measurements above 1 GHz have been performed using the most stringent limit for restricted band which equate to -21.2/-41.2 dBm EIRP Peak/Avg based on 54/74 dBµV/m requirements.

FCC 47 CFR Part 15, Limit Clause 15.247 (d)

20 dB below the fundamental measured in a 100 kHz bandwidth using a peak detector. If the transmitter complies with the conducted power limits, based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB below the fundamental instead of 20 dB.

Industry Canada RSS-247, Limit Clause 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under section 5.4(d), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

2.5.7 Test Location and Test Equipment Used

|-----------------|-------------------------|-----------------------------|
| 12.14 | 15 | 182.10 |

Table 36

Figure 63 - Dwell Time

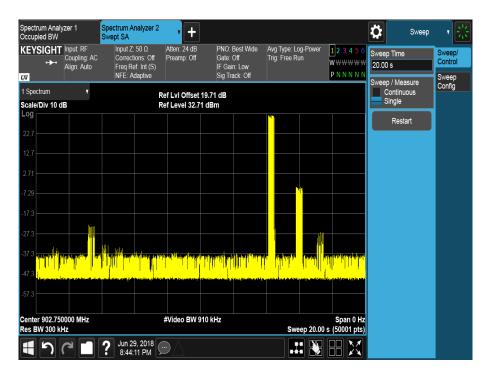

Figure 64 - Total Average Time of Occupancy

Remarks

Each sequence of bursts is made up of 15 transmissions of approximately 12.14 ms in duration. In any 20 second period no more than one burst sequence occurs therefore the maximum occupation time within 20 s is no more than 182.2 ms.

FCC 47 CFR Part 15, Limit Clause (a)(1)(i)

For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequencies and the average time of occupancy on any frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Industry Canada RSS-247, Limit Clause 5.1 (c)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a 20second period. If the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping channels and the average time of occupancy on any channel shall not be greater than 0.4 seconds within a 10-second period.

2.9.3 Date of Test

28-June-2018

2.9.4 Test Method

The EUT was connected to a spectrum analyser via a cable and attenuator. The automatic 'X' dB bandwidth functionality of the spectrum analyser was used, where 'X' was set to 20 dB.

The RBW was approximately set to 5% of the span using a peak detector and max-hold trace. Once the trace was sufficiently built up the result was recorded, and the screen image captured as shown below.
