ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15C, ISED RSS-247 and ISED RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

EXECUTIVE SUMMARY

A sample of this product was tested and found to be compliant with FCC 47 CFR Part 15C: 2020, ISED RSS-247: Issue 2 (02-2017) and ISED RSS-GEN: and Issue 5 (04-2018) + A2 (02-2021) for the tests detailed in section 1.3.

DISCLAIMER AND COPYRIGHT

This non-binding report has been prepared by TÜV SÜD with all reasonable skill and care. The document is confidential to the potential Client and TÜV SÜD. No part of this document may be reproduced without the prior written approval of TÜV SÜD. © 2022 TÜV SÜD. This report relates only to the actual item/items tested.

ACCREDITATION

Our UKAS Accreditation does not cover opinions and interpretations and any expressed are outside the scope of our UKAS Accreditation. Results of tests not covered by our UKAS Accreditation Schedule are marked NUA (Not UKAS Accredited).

 Position held: VP Engineering
 Date: 4 February 2022

1.5 Product Information

1.5.1 Technical Description

The EUT is a UHF RFID Distributed Antenna System - intended use detection and monitoring of UHF RFID tags.

1.5.2 Additional Information

The manufacturer stated that all 8-ports are electrically identical, therefore conducted measurements were only performed on port 1, which is representative of results from any given port.

The equipment under test (EUT) uses antennas with multiple inputs, the radiating antenna beams do not overlap and therefore antenna port summing of conducted power is not required to calculate the total ERP.

1.6 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

1.7 EUT Modification Record

The table below details modifications made to the EUT during the test programme.

The modifications incorporated during each test are recorded on the appropriate test pages.

Modification State	Description of Modification still fitted to EUT	Modification Fitted By	Date Modification Fitted
Model: FR 9380 (8-port FCC), Serial Number: 10510422-0074			
0	As supplied by the customer	Not Applicable	Not Applicable
1	<p>The unit originally supplied was a v6.5.2 but we have updated it to v6.5.4 to improve the FCC emissions and PA resilience. This is covered by ECN028 and ECN030 which can be summarised as follows:</p> <ol style="list-style-type: none"> 1. Improve the TX harmonic filtering by adjusting the output filter component values. 2. Improve radiated emissions by fitting Eccosorb to the enclosure lid. 3. Limit the maximum current the PA can draw when incorrectly loaded so that it cannot burn itself out 	Martin Neuhaus	07-June-2022

Table 14

1.8 Test Location

TÜV SÜD conducted the following tests at our Fareham Test Laboratory.

Test Name	Name of Engineer(s)	Accreditation
Configuration and Mode: RFID Transceiver		
AC Power Line Conducted Emissions	Graeme Lawler	UKAS
Frequency Hopping Systems - Average Time of Occupancy	Neil Rousell	UKAS
Frequency Hopping Systems - Channel Separation	Nandhini Mathivanan	UKAS
Frequency Hopping Systems - Number of Hopping Channels	Nandhini Mathivanan	UKAS
Frequency Hopping Systems - 20 dB Bandwidth	Nandhini Mathivanan	UKAS
Maximum Conducted Output Power	Nandhini Mathivanan	UKAS
Conducted Spurious Emissions from the Antenna Port	Neil Rousell	UKAS
Spurious Radiated Emissions	Graeme Lawler	UKAS
Authorised Band Edges	Nandhini Mathivanan	UKAS

2 Test Details

2.1 AC Power Line Conducted Emissions

2.1.1 Specification Reference

FCC 47 CFR Part 15C, Clause 15.207
ISED RSS-247, Clause 3.1
ISED RSS-GEN, Clause 8.8

2.1.2 Equipment Under Test and Modification State

FR 9380 (8-port FCC), S/N: 10510422-0074 - Modification State 1

2.1.3 Date of Test

08-August-2022

2.1.4 Test Method

The test was performed in accordance with ANSI C63.10, clause 6.2.

The EUT was placed on a non-conductive table 0.8m above a reference ground plane and 0.4m away from a vertical coupling plane.

All power was connected to the EUT through an Artificial Mains Network (AMN).

Conducted disturbance voltage measurements on mains lines were made at the output of the AMN.

The EUT was set to transmit on the bottom channel for each of the 8 ports. This is the channel where the highest conducted power was measured.

2.1.5 Environmental Conditions

Ambient Temperature	18.4 °C
Relative Humidity	51.5 %

2.1.6 Test Results

RFID Transceiver

Applied supply voltage: 118 V AC

Applied supply frequency: 60 Hz

2.6.2 Equipment Under Test and Modification State

FR 9380 (8-port FCC), S/N: 10510422-0074 - Modification State 0

2.6.3 Date of Test

07-February-2022

2.6.4 Test Method

The test was performed in accordance with ANSI C63.10, clause 11.9.1.1

2.6.5 Environmental Conditions

Ambient Temperature	22.9 °C
Relative Humidity	40.0 %

2.6.6 Test Results

RFID Transceiver

Testing was performed on the modulation/packet type with the highest conducted output power.

Frequency (MHz)	Maximum Output Power	
	dBm	mW
902.75	29.72	937.56
914.75	29.42	874.98
927.25	29.60	912.01

Table 27

FCC 47 CFR Part 15, Limit Clause 15.247 (b)(2)

For frequency hopping systems operating in the 902–928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels.

ISED RSS-247, Limit Clause 5.4 (a)

For FHSs operating in the band 902-928 MHz, the maximum peak conducted output power shall not exceed 1.0 W, and the e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels; the maximum peak conducted output power shall not exceed 0.25 W and the e.i.r.p. shall not exceed 1 W if the hopset uses less than 50 hopping channels.

2.6.7 Test Location and Test Equipment Used

This test was carried out in RF Laboratory 2.

ISED RSS-247, Clause 3.3 and 5.5
ISED RSS-GEN, Clause, 6.13 and 8.9

2.7.2 Equipment Under Test and Modification State

FR 9380 (8-port FCC), S/N: 10510422-0074 - Modification State 0

2.7.3 Date of Test

23-August-2022

2.7.4 Test Method

The EUT antenna port was connected directly to the spectrum analyser via a cable and attenuator. In addition to this test, a radiated measurement of the cabinet emissions was also performed.

This test was performed in accordance with ANSI C63.10 clause 7.8.8 for measurements in non-restricted bands.

For measurements in restricted bands a conducted procedure was used to measure the emissions from a single antenna port using the procedure described in clause 11.12.2.

2.7.5 Environmental Conditions

Ambient Temperature	23.7 °C
Relative Humidity	57.2 %

FCC 47 CFR Part 15, Limit Clause 15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in 15.209(a)

ISED RSS-247, Limit Clause 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section 5.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

In addition, radiated emissions which fall in the restricted bands, as defined in RSS-GEN, clause 8.10, must also comply with the radiated emission limits specified in RSS-GEN clause 8.9.

2.7.7 Test Location and Test Equipment Used

This test was carried out in RF Laboratory 2.

FR 9380 (8-port FCC), S/N: 10510422-0074 - Modification State 1

2.8.3 Date of Test

27-March-2022 to 31-July-2022

2.8.4 Test Method

This test was performed in accordance with ANSI C63.10, clause 6.3, 6.5 and 6.6.

For frequencies > 1 GHz, plots for average measurements were taken in accordance with ANSI C63.10, clause 4.1.5.2.6 to characterize the EUT. Where emissions were detected, final average measurements were taken in accordance with ANSI C63.10, clause 4.1.5.2.2. A duty cycle correction factor has been added to the CISPR Average measurements.

The EUT was placed on the non-conducting platform in a manner typical of a normal installation.

Ports on the EUT were terminated with loads as described in ANSI C63.4 clause 6.2.4. For EUT's with multiple connectors of the same type, additional interconnecting cables were connected, and pre-scans performed to determine whether the level of the emissions were increased by >2 dB.

The plots shown are the characterisation of the EUT. The limits on the plots represent the most stringent case for restricted bands, (74/54 dBuV/m) when compared to 20 dBc outside restricted bands. The limits shown have been used as a threshold to determine where further measurements are necessary. Where results are within 10 dB of the limits shown on the plots, further investigation was carried out and reported in results tables.

The following conversion can be applied to convert from dB μ V/m to μ V/m:

$10^{(\text{Field Strength in dB}\mu\text{V/m}/20)}$.

Where formal measurements have been necessary, the results have been presented in the emissions table.

For testing below 1 GHz, the EUT has been powered by a linear power supply. Above 1 GHz, the EUT has been powered by the supplied SMPSU.

FCC 47 CFR Part 15, Limit Clause 15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in 15.209(a)

ISED RSS-247, Limit Clause 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section 5.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

In addition, radiated emissions which fall in the restricted bands, as defined in RSS-GEN, clause 8.10, must also comply with the radiated emission limits specified in RSS-GEN clause 8.9.

4 Measurement Uncertainty

For a 95% confidence level, the measurement uncertainties for defined systems are:

Test Name	Measurement Uncertainty
AC Power Line Conducted Emissions	150 kHz to 30 MHz, LISN, ± 3.7 dB
Frequency Hopping Systems - Average Time of Occupancy	-
Frequency Hopping Systems - Channel Separation	13.325 kHz
Frequency Hopping Systems - Number of Hopping Channels	-
Frequency Hopping Systems - 20 dB Bandwidth	5.864 kHz
Maximum Conducted Output Power	± 1.38 dB
Conducted Spurious Emissions from the Antenna Port	30 MHz to 1 GHz: ± 5.2 dB 1 GHz to 40 GHz: ± 6.3 dB
Spurious Radiated Emissions	30 MHz to 1 GHz: ± 5.2 dB 1 GHz to 40 GHz: ± 6.3 dB
Authorised Band Edges	30 MHz to 1 GHz: ± 5.2 dB 1 GHz to 40 GHz: ± 6.3 dB

Table 39

Measurement Uncertainty Decision Rule – Accuracy Method

Determination of conformity with the specification limits is based on the decision rule according to IEC Guide 115:2007, Clause 4.4.3 and 4.5.1. (Procedure 2). The measurement results are directly compared with the test limit to determine conformance with the requirements of the standard.

Risk: The uncertainty of measurement about the measured result is negligible with regard to the final pass/fail decision. The measurement result can be directly compared with the test limit to determine conformance with the requirement (compare IEC Guide 115). The level of risk to falsely accept and falsely reject items is further described in ILAC-G8.
