Measurement/Technical Report for

A.R.I. Flow Control Accessories LTD

ARISense Smart Air Valve System

Master Unit

FCC ID: 2ASHC-ARISENSE-M19

This report concerns:	Original Grant: X Class II change: Class I change:
Equipment Class:	TNB – Licensed Non-Broadcast Station Transmitter
Limits used:	47CFR Parts 2; 90

Measurement procedure used is ANSI C63.26-2015.

Substitution Method used as in ANSI TIA-603-E (2016)

Application for Certification
prepared by:
R. Pinchuck

TABLE OF CONTENTS

1. General Information

1.1 Administrative Information

Manufacturer:	A.R.I. Flow Control Accessories LTD
Manufacturer's Address:	Kfar Haruv, Golan Heights 1293200, Israel Tel: +972 4-676-1786
Manufacturer's Representative:	Amir Chapnik
Equipment Under Test (E.U.T):	ARISense Smart Air Valve System
Equipment Model No.:	Master Unit; External Box Unit* (*see customer declaration on following page)
Equipment Serial No.:	Not designated
Date of Receipt of E.U.T:	January 21, 2019
Start of Test:	January 21, 2019
End of Test:	January 5, 2020
Test Laboratory Location:	I.T.L (Product Testing) Ltd. 1 Batsheva St, Lod, Israel 7120101
Test Specifications	FCC Part 2, 90

ARISENSE

August 28, 2019

DECLARATION

I hereby declare the following regarding the below models:

#	Product Name/Model
1	Master unit
2	External box unit

All of the above models use the same PCB.

These models are identical except for the following:

1. Master unit is assembled on an air valve versus the external box unit which is an independent unit.
2. The outer plastic casing is different between the models.

Please relate to them (from a Radio point of view) as the same product.
Thank you,

Signature: _____
Printed Name: Amir Chapnik
Title: R&D Eng.

1.2 List of Accreditations

The EMC laboratory of I.T.L. is accredited by/registered with the following bodies:

1. The American Association for Laboratory Accreditation (A2LA) (U.S.A.), Certificate No. 1152.01.
2. The Federal Communications Commission (FCC) (U.S.A.), FCC Designation Number is IL1005.
3. The Israel Ministry of the Environment (Israel), Registration No. 1104/01.
4. Department of Innovation, Science and Economic Development (ISED) Canada, CAB identifier: IL1002

I.T.L. Product Testing Ltd. is accredited by the American Association for Laboratory Accreditation (A2LA) and the results shown in this test report have been determined in accordance with I.T.L.'s terms of accreditation unless stated otherwise in the report.

1.3 Test Methodology

Radiated and conducted testing was performed according to the procedures in ANSI C63.26: 2015 and ANSI/TIA-603-E: 2016, Section 2.2.12.

1.4 Product Description

A.R.I.'s ARISENSE is a Data Transmitting System that collects and transmits Air Valves' status and accessories data to a central web server.
The system provides a comprehensive view of the air valves installed at the water system pipelines.
It detects abnormal issues before they occur, notifies needs for service, significantly reduces maintenance costs and prevents fines caused by leakage, spillage, clogging, tilting, vandalism, high pressure and flooding.
ARISENSE employs a combination of sensors integrated within the air valve's housing that continuously monitor the valve's functioning and performance, and transmit the data to the web server.

2. System Test Configuration

2.1 Justification

2.1.1. The E.U.T contain 2 transceivers: A Telit approved cellular 3G cellular module certified under FCC ID: RI7UL865NA and UHF 450-460MHz band for which certification is sought. The 2 transmitters do not transmit simultaneously.

2.1.2. Radiated emission evaluation was performed in typical installation orientation as declared by the customer.

2.1.3. The E.U.T has 2 types of enclosures (Master Unit and External Box Unit). Based on exploratory testing that was performed Master Unit was the "worst case".

Unit Enclosure Type	Fundamental (dBuV/m)	2nd Harmonic (dBuV/m)
Master Unit	132.1	92.3
External Box Unit	118.3	92.0

Figure 1. Screening Results

2.1.4. The E.U.T also has 4 optional valve types. Based on exploratory testing that was performed, the "worst case" valve was the CAT No. valve: D-040.

CAT No. Valve	Fundamental (dBuV/m)	2nd Harmonic (dBuV/m)
D-020	130.0	90.0
D-025L	128.8	90.8
D-025	128.4	81.8
D-040	132.1	92.3

Figure 2. Screening Results – Valve Type

2.1.5. Only for testing purposes, the E.U.T was powered from an AC/DC power supply. In operational mode, the E.U.T is only battery operated.

2.2 EUT Exercise Software

I-VE Tool via USB

2.3 Special Accessories

AC/DC adapter:
Manufacturer: Active energe
Part number: ACT 3.65-1.5
Serial number: N/A

2.4 Equipment Modifications

Initially, the E.U.T didn't meet the spurious emission requirements (-20dBm). The manufacturer took the following corrective action:
The output buffer level at the frequencies of 450.006 & 460MHz was changed to "55" buffer level.

2.5 Configuration of Tested System

Product Name	ARISense Smart Air Valve System
Model Name	Master Unit
Working voltage	3.6VDC battery operated (Lithium)
Mode of operation	Transceiver
Modulations	GFSK
Assigned Frequency Range	450-470MHz
Operation Frequency Rang	450.006- 460.000MHz
Transmit power(conducted)	~ 0dBm
Antenna Gain	1 dBi
DATA rate	N/A
Modulation BW	12.5kHz

4. RF Power Output

4.1 Test Specification

FCC, Part 90, Section 205(h)

4.2 Test Procedure

(Temperature (22°C)/ Humidity (52%RH))
Test method used: ANSI C63.26 (2015), Section 5.2.3.3

The E.U.T was placed on a remote-controlled turntable in the OATS.
The E.U.T was placed on a non-metallic table, 0.8 meters above the ground, at a distance of 3 meters. The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization.

Radiated output power levels were measured at selected operation frequencies and the results were converted to power level according to the formula as shown below:

$$P = \frac{(E_{V/m} \times d)^2}{(30 \times G)} \text{ [W]}$$

E - Field Strength (V/m)

d – Distance from transmitter (m)

G – Antenna gain

P – Peak power (W)

ERP(dBm)= EIRP(dBm)- 2.15

4.3 Test Limit

Maximum ERP 2W (33dBm).

4.4 Test Results

Carrier Channel	Antenna Pol.	Maximum Peak Level	Effective Radiated Power Level	Limit	Margin
(MHz)	(V/H)	(dBµV/m)	(dBm)	(dBm)	(dB)
450.006	V	122.6	25.3	33.0	-7.7
	H	112.2	14.9	33.0	-18.1
460.000	V	123.5	26.2	33.0	-6.8
	H	117.6	20.3	33.0	-12.7

5. Occupied Bandwidth

5.1 Test Specification

FCC, Part 90, Sub Part I, Section 209(b)(5)

5.2 Test Procedure

(Temperature (22°C)/ Humidity (62%RH))
Test method used: ANSI C63.26 (2015), Section 5.4.4

The E.U.T.'s antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable. Special attention was taken to prevent Spectrum Analyzer RF input overload.
RBW set to value between 1% to 5% from the OBW.

5.3 Test Limit

Operations using equipment designed to operate with a 12.5 kHz channel bandwidth will be authorized at 11.25 kHz bandwidth.

5.4 Test Results

7. Spurious Radiated Emission

7.1 Test Specification

FCC, Part 90, Sub Part I, Section 210

7.2 Test Procedure

(Temperature (28°C)/ Humidity (50%RH))
Test method used: ANSI C63.26 (2015), Section 5.5.3

For measurements between 0.009MHz-30.0MHz:

The E.U.T was tested inside the shielded room and placed on a non-metallic table, 0.8 meters above the ground. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.

The frequency range 0.009MHz-30MHz was scanned.

For measurements between 30.0MHz-1.0GHz:
A preliminary measurement to characterize the E.U.T was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground, at a distance of 3 meters. The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization.
The frequency range 30.0MHz -1.0GHz was scanned and the list of the highest emissions was verified and updated accordingly.

For measurements between 1.0GHz-5.0GHz:

The E.U.T was tested inside the shielded room and placed on a non-metallic table, 1.5 meters above the ground. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.

The frequency range 1.0GHz -5.0GHz was scanned.

The E.U.T. was replaced by a substitution antenna driven by a signal generator. The height was readjusted for maximum reading. The signal generator level was adjusted to obtain the same reading on the EMI receiver
The signals observed were converted to radiated power using:

$P_d(dBm) = P_g(dBm) – Cable\ Loss\ (dB) + Substitution\ Antenna\ Gain\ (dBd)$

P_d = Dipole equivalent power (result).
P_g = Signal generator output level.
A Peak detector was using for this test.

The table below describe only results with the highest radiation.

7.3 Test Limit

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 50 + 10*log (P) dB, yielding –20dBm.

7.4 Test Results

Carrier Channel	Freq.	Antenna Pol.	Maximum Peak Level	Signal Generator RF Output	Cable Loss	Antenna Gain	Effective Radiated Power Level	Limit	Margin

8. Transmitter Frequency Stability

8.1 Test Specification

FCC, Part 90, Sub Part I, Section 213; Part 2, Section 1055

8.2 Test Procedure

(Temperature (22°C)/ Humidity (45%RH))
Test method used: ANSI C63.26 (2015), Section 5.2.6

The E.U.T operation mode and test setup are as described in Section 2 of this report.

The E.U.T. was operated with a CW signal at 460MHz.

The E.U.T. was placed inside a temperature chamber.

The spectrum analyzer was set to 20.0 kHz span and 1.0 kHz RBW, 3.0 kHz VBW.

Counter function was set for this evaluation.

The E.U.T. was operated from external 3.6VDC at nominal temperature (+25.0°C).

The carrier frequency was measured and recorded (reference frequency reading).

The carrier frequency was measured and recorded after at least 20 minutes of exposing the E.U.T. to the temperature.

8.3 Test Limit

In the 421-512 MHz band, fixed and base stations with a 12.5 kHz channel bandwidth must have a frequency stability of ± 1.5 ppm (690Hz).

8.4 Test Results

JUDGEMENT: Passed

The details of the results are given in *Figure 26.*

Transmitter Frequency Stability

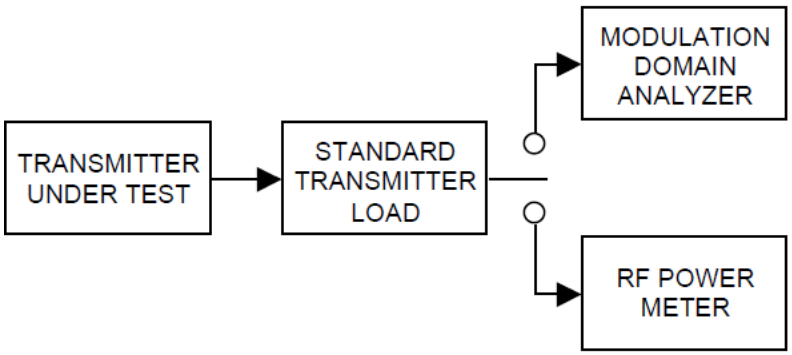
9. Transient Frequency Behavior

9.1 Test specification

FCC, Part 90, Section 214

9.2 Test Procedure

(Temperature (22°C)/ Humidity (45%RH))
Test method used: ANSI TIA 603 -E, Section 2.2.19



9.3 Test Limit

Transmitters designed to operate in the 150-174 MHz and 421-512 MHz frequency bands must maintain transient frequencies within the maximum frequency difference limits during the time intervals indicated:

Time Intervals	Maximum Frequency Difference	421 to 512 MHz
T1*	±12.5kHz	10msec
T2	±6.25kHz	25msec
T3*	±12.5kHz	10msec

**note: If the transmitter carrier output power rating is 6 watts or less, the frequency difference during this time period may exceed the maximum frequency difference for this time period*

Figure 30 Test Equipment Used

10. Antenna Type/Information

Dipole, printed antenna, peak gain 1.0dBi

11. RF Exposure/Safety

The E.U.T. is a Smart Air valve System Master Unit. Typical placement of the E.U.T. on an air valve. The typical distance between the E.U.T. and the user is at least 20cm.

Calculation of Maximum Permissible Exposure (MPE)
Based on Section 1.1310 Requirements

Using table 1 of Section 1.1310 limit for general population/uncontrolled exposures, the above level is an average over 30 minutes.

1) FCC limit at 460 MHz is: f/1500 (mW/cm^2) = 460/1500 = 0.31 (mW/cm^2)
2) The power density produced by the E.U.T. is

$$S = \frac{P_t G_t}{4\pi R^2}$$

P_t- Transmitted Power =EIRP =26.2dBm – 1dBi antenna gain = 25.2dBm
Antenna dipole, printed antenna 450-470MHz; 16.5cm; 1dBi

G_T- Antenna Gain, 1 dBi gain =1.26 numeric

R- Distance from Transmitter using 20cm worst case

3) The peak power density is:

S= 25.2 x1.26/4π(20^2) = 0.006W/cm^2

This is below the FCC limit of 0.31 (mW/cm^2)

17000.0	7.9
18000.0	8.1
19000.0	8.8
20000.0	9.1

NOTES:

1. The cable is manufactured by Commscope

2. The cable type is 0623 WBC-400, serial # G020132 and 10m long

12.3 Correction factors for Active Loop Antenna

ITL # 1075

F(MHz)	AF(dB/m)
0.01	18.4
0.02	14.3
0.03	13.3
0.05	11.7
0.1	11.4
0.2	11.2
0.3	11.2
0.5	11.2
0.7	11.2
1	11.4
2	11.5
3	11.5
4	11.4
5	11.3

7	11.1
8	11.1
9	11
10	11
20	10
30	8

12.4 Correction factors for biconical antenna ITL #1356

Frequency [MHz]	AF [dB/m]
30	13.00
35	10.89
40	10.59
45	10.63
50	10.12
60	9.26
70	7.74
80	6.63
90	8.23
100	11.12
120	13.16
140	13.07
160	14.80
180	16.95
200	17.17

12.5 Correction factors for log periodic antenna ITL # 1349

Frequency [MHz]	AF [dB/m]
200	11.58
250	12.04
300	14.76
400	15.55
500	17.85
600	18.66
700	20.87
800	21.15
900	22.32
1000	24.22

12.6 Correction factors for Double –Ridged Waveguide Horn ANTENNA 3 meter range; ITL # 1352

FREQUENCY (GHz)	AFE (dB/m)	FREQUENCY (GHz)	AFE (dB/m)
0.75	25.0	9.5	38.0
1.0	23.5	10.0	38.5
