ANAB

Compliance Testing, LLC, has been accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to the joint ISO-ILAC-IAF Communiqué dated January 2009).

The tests results contained within this test report all fall within our scope of accreditation, unless noted below.

Please refer to <u>http://www.compliancetesting.com/labscope.html</u> for current scope of accreditation.

FCC Site Reg. #349717

IC Site Reg. #2044A-2

The applicant has been cautioned as to the following

15.21 - Information to User

The user's manual or instruction manual for an intentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

15.27(a) - Special Accessories

Equipment marked to a consumer must be capable of complying with the necessary regulations in the configuration in which the equipment is marketed. Where special accessories, such as shielded cables and/or special connectors are required to enable an unintentional or intentional radiator to comply with the emission limits in this part, the equipment must be marketed with, i.e. shipped and sold with, those special accessories. However, in lieu of shipping or packaging the special accessories with the unintentional or intentional radiator, the responsible party may employ other methods of ensuring that the special accessories are provided to the consumer without an additional charge.

Information detailing any alternative method used to supply the special accessories for a grant of equipment authorization or retained in the verification records, as appropriate. The party responsible for the equipment, as detailed in § 2.909 of this chapter, shall ensure that these special accessories are provided with the equipment. The instruction manual for such devices shall include appropriate instructions on the first page of text concerned with the installation of the device that these special accessories must be used with the device. It is the responsibility of the user to use the needed special accessories supplied with the equipment.

Standard Test Conditions Engineering Practices

Except as noted herein, the following conditions and procedures were observed during the testing:

In accordance with ANSI C63.10-2013 and unless otherwise indicated in the specific measurement results, the ambient temperature of the actual EUT was maintained within the range of 10° to 40°C (50° to 104°F) unless the particular equipment requirements specified testing over a different temperature range. Also, unless otherwise indicated, the humidity levels were in the range of 10% to 90% relative humidity.

Measurement results, unless otherwise noted, are worst-case measurements.

Environmental Conditions					
Temperature (°C)	Humidity (%)	Pressure (mbar)			
27.0	47.5	969.5			

EUT Description Model: CM2.5-1113120 Description: G2.5 Cargo Container Tracking Device Firmware: NA Software: NA Serial Number: AP Conducted: 622130394 Radiated: 622131008

Frequency Range of Operation: 2402 - 2480 MHz Modulation: BLE GFSK Antenna: chip antenna with 1.0 dBi gain

General Description of EUT and its intended use:

The DUT is a battery powered mobile transceiver for digital transmission.

EUT operation during test:

The DUT was operated at maximum RF output for all tests in this report. The EUT was placed in a continuous transmit mode with a BLE 1MHz Bandwidth. This is the only modulation utilized within the band and therefore is worst case.

Simultaneous Transmission

The EUT does not support simultaneous transmission.

	Support Equipment			
Qty	Description	Manufacturer	Model	S/N
1	DC power supply	Mastech	HY1803D	N/A
	Support Cables: N/A			
	Modifications:			
	none			
15.203:	Antenna Requirement:			

Χ	The antenna is permanently attached to the EUT
	The antenna uses a unique coupling
	The EUT must be professionally installed
	The antenna requirement does not apply

Peak Output Power Engineer: Alex Macon Test Date: 10/18/2022

Test Procedure

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna to verify that the EUT met the requirements for peak output power. The peak readings were taken, and the result was then compared to the limit. The test was performed per section 11.9.1.1 of ANSI C63.10:2013 as the procedure for determining "Fundamental emission output power, RBW greater than or equal to DTS bandwidth."

The Spectrum Analyzer was set to the following:

 $RBW \ge DTS Bandwidth$ $VBW \ge 3 \times RBW$ $Span \ge 3 \times RBW$ Sweep time = auto couple Detector = peakTrace Mode = max hold

The EUT was set to transmit on the lowest, middle, and highest frequencies at the maximum power level. The RF output power was measured using the RBW \geq DTS bandwidth method.

High Channel Peak Power

Occupied Bandwidth Engineer: Alex Macon Test Date:10/18/2022

Test Procedure

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna The 6dB bandwidth test was performed per section 11.8.1 of ANSI C63.10:2013 "Procedure for determining DTS Bandwidth for DTS devices".

The Spectrum Analyzer was set to the following for 6 dB DTS BW: RBW = 100 kHz VBW \ge 3 x RBW Peak Detector Trace mode = max hold Sweep = auto couple Span = 1.5 x EBW

Test Setup

6 dB Occupied Bandwidth Summarv

Frequency (MHz)	6 dB Measured Bandwidth (kHz)	Specification Limit (kHz)	Result	99% OCBW (kHz)

Low Channel 6dB Bandwidth

Mid Channel 6dB Bandwidth

High Channel 6dB Bandwidth

Transmitter Power Spectral Density (PSD) Engineer: Alex Macon Test Date: 8/18/2022

Test Procedure

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna. The test was performed per section 11.10.2 of ANSI C63.10:2013 "Maximum power spectral density level in the fundamental emission, Method PKPSD (peak PSD)."

The Spectrum Analyzer was set to the following: DTS channel center frequency Span 1.5 x DTS bandwidth RBW =3 kHz \leq RBW \leq 100 kHz VBW \geq 3 x RBW Peak Detector Sweep time = auto couple Trace mode = max hold

Test Setup

PSD Summary

Frequency (MHz)	Measured Data (dBm)	Specification Limit (dBm)	Result
2402	-8.69	8	Pass

High Channel PSD

Radiated Spurious Emissions Engineer: Alex Macon Test Date: 10/18/22

Test Procedure Radiated Spurious Emissions:

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna. A spectrum analyzer was used to verify that the EUT met the requirements for Radiated Emissions that fall under restricted bands of 15.205 to the requirements of 15.209. The EUT was tested by rotating it 360° with the antennas in both the vertical and horizontal orientation and was raised from 1 to 4 meters to ensure the TX signal levels were maximized. All 3 axis were investigated in this manner and the worst case is reported. The EUT was terminated into a 50 ohm load for radiated testing. The test was performed per section 11.12 of ANSI C63.10:2013

All emissions from 30 MHz to 10th harmonic of the fundamental were examined. Measured Level includes antenna, preamplifier and the receiver cable correction factors. Correction factors were input into the spectrum analyzer before recording "Measured Level".

For emissions below 1 GHz:

RBW = 120 kHz VBW = 300 kHz Detector – Quasi Peak

For emissions above 1 GHz:

RBW = 1 MHz VBW = 3 MHz Detector – Peak and Average

No emissions were detectable above noise floor beyond 18 GHz.

30MHz to 1GHz Low channel

30MHz to 1GHz Mid channel

30MHz to 1GHz High channel

1GHz to 6 GHz Low channel

1GHz to 6 GHz Mid channel

1GHz to 6 GHz High channel

No emissions were found above 18 GHz

Frequency MHz

Emissions at Band Edges

Engineer: Alex Macon

Test Date: 8/18/2022

Test Procedure

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna and the procedure from section 11.11 of ANSI C63.10 was followed to measure the emissions at the band edges in 100 kHz bandwidth.

Band Edge Test Setup

Measurement Uncertainty

Measurement Uncertainty (U_{lab}) for Compliance Testing is listed in the table below.

Measurement	Ulab		
Radio Frequency	± 3.3 x 10 ⁻⁸		
RF Power, conducted	± 1.5 dB		
RF Power Density, conducted	± 1.0 dB		
Conducted Emissions	± 1.8 dB		
Radiated Emissions	± 4.5 dB		
Temperature	± 1.5 deg C		
Humidity	± 4.3 %		
DC voltage	± 0.20 VDC		
AC Voltage	± 1.2 VAC		

The reported expanded uncertainty +/- U_{lab}(dB) has been estimated at a 95% confidence level (k=2)

 U_{lab} is less than or equal to U_{ETSI} therefore

- Compliance is deemed to occur if no measured disturbance exceeds the disturbance limit
- Non-Compliance is deemed to occur if any measured disturbance exceeds the disturbance limit

In addition to the above listed equipment standard RF connectors and cables were utilized in the testing of the described equipment. Prior to testing these components were tested to verify proper operation.

END OF TEST REPORT
