

# TEST REPORT

<b>KOSTEC Co., Ltd.</b> 28(175-20, Annyeong-dong) 406-gil sejaro, Hwaseong-si, Gyeonggi-do, Korea Tel:031-222-4251, Fax:031-222-4252	Report No.: KST-FCR-240002(1)	
<b>1. Applicant</b> <ul style="list-style-type: none"><li>• Name : Geoplan Co., Ltd.</li><li>• Address : 622, Geumjeong SKV1, 142, LS-ro, Dongan-gu, Anyang-si, Gyeonggi-do, South Korea</li></ul>		
<b>2. Test Item</b> <ul style="list-style-type: none"><li>• Product Name: UWB Tag</li><li>• Model Name: TR100</li><li>• Brand: None</li><li>• FCC ID: 2ASPN-TR100</li></ul>		
<b>3. Manufacturer</b> <ul style="list-style-type: none"><li>• Name : Geoplan Co., Ltd.</li><li>• Address : 622, Geumjeong SKV1, 142, LS-ro, Dongan-gu, Anyang-si, Gyeonggi-do, South Korea</li></ul>		
4. Date of Test : 2023. 12. 12. ~ 2023. 12. 13.		
5. Test Method Used : FCC CFR 47, Part 15. Subpart F-15.519 ANSI C 63.10-2013		
6. Test Result : Compliance		
7. Note: None		
<b>Supplementary Information</b> <p>The device bearing the brand name and FCC ID specified above has been shown to comply with the applicable technical standards as indicated in the measurement report and was tested in accordance with measurement procedures specified in <u>ANSI C 63.10-2013</u>.</p> <p>We attest to the accuracy of data and all measurements reported herein were performed by KOSTEC Co., Ltd. and were made under Chief Engineer's supervision. We assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.</p>		
The results shown in this test report refer only to the sample(s) tested unless otherwise stated. This test report is not related to KOLAS accreditation.		
Affirmation	Tested by Name : Choo, Kwang-Yeol (Signature)	Technical Manager Name : Lee, Mi-Young (Signature)
2024. 04. 19.		
<b>KOSTEC Co., Ltd.</b>

## 1. GENERAL INFORMATION

### 1.1 Test Facility

#### Test laboratory and address

KOSTEC Co., Ltd.

28(175-20,Annyeong-dong)406-gil sejaro, Hwaseong-si Gyeonggi-do, Korea

Telephone Number: 82-31-222-4251

Facsimile Number: 82-31-222-4252

#### Registration information

KOLAS No.: KT232

RRA (National Radio Research Agency): KR0041

FCC Designation No.: KR0041

IC Designation No.: KR0041

VCCI Membership No.: 2005

### 1.2 Location

### 1.3 Revision History of test report

Rev.	Revisions	Effect page	Reviewed	Date
-	Initial issue	All	Gyeong Hyeon, Park	2024. 01. 05.
1	Added Procedure Reference (KDB 393764) and included a statement about the test distance	10, 13 16, 21, 24	Mi-Young, Lee	2024. 04. 19.

## 2. EQUIPMENT DESCRIPTION

The product specification described herein was declared by manufacturer. And refer to user's manual for the details.

Equipment Name	UWB Tag
Model No	TR100
Usage	UWB Tag
Use Environment	Indoors and Outdoors
Serial Number	Proto type
Modulation type	BPSK/BPM
Emission Type	IEEE 802.15.4-2011 UWB
Maximum Output Power	74.80 dB $\mu$ V/m
Operated Frequency	7 987.2 MHz
Channel Number	1
Operation temperature	-30 °C ~ 60 °C
Power Source	DC 3.0 V(CR2450 Coin Battery)
Antenna Description	Internal Chip antenna, max gain : 2.0 dBi
Remark	<ol style="list-style-type: none"><li>1. The device was operating at its maximum output power for all measurements.</li><li>2. The radiation measurements are performed in X, Y, Z axis positioning. Only the worst case (X) is shown in the report.</li><li>3. The above DUT's information was declared by manufacturer. Please refer to the specifications or user manual for more detailed description.</li></ol>
FCC ID	2ASPN-TR100

### 3. SYSTEM CONFIGURATION FOR TEST

#### 3.1 Characteristics of equipment

Potable UWB device and RTLS(Real-Time Locating System) Tag.

#### 3.2 Used peripherals list

Description	Model No.	Serial No.	Manufacture	Remark
Notebook	TP00106A	PC-1HBV52	Lenovo	-
Adapter	ADLX45YDC3D	8SSA10R16864D1SG 04E0PXX	Lenovo	For notebook

#### 3.3 Product Modification

N/A

#### 3.4 Operating Mode

The EUT was used for making continuous transmitting and receiving mode during the test.

#### 3.5 Test Setup of EUT

The measurements were taken in continuous transmit mode using the test mode which controlled by CMD. The test command and the test Jig and cables were provided by the applicant.

### 3.6 Parameters of Test Software Setting

During testing, Channel & Power Controlling Software provided by the customer was used to control the operating channel as well as the output power level. The RF output power selection is for the setting of RF output power expected by the customer and is going to be fixed on the firmware of the final end product.

■ TX Power setting value during test

Band	TX Power setting value
7 987.2 MHz	50

■ Test Program : CMD\_UWB – Demo test mode

```

UWB - Demo test mode for cw

Antenna Requirement	§ 15.203	Clause 5.6	<input checked="" type="checkbox"/>	Compliance
AC Power Conducted emissions	§ 15.207	Clause 5.7	<input type="checkbox"/>	N/A <sup>1)</sup>

Compliance: The EUT complies with the essential requirements in the standard.  
 Not Compliance : The EUT does not comply with the essential requirements in the standard.  
 N/A : The test was not applicable in the standard.

1) The test is not applicable because the EUT is powered by the coin battery only and will not be connected to the public utility(AC) power line.

#### Procedure Reference

FCC CFR 47, Part 15. Subpart F-15.519

ANSI C 63.10-2013

KDB 393764 D01 UWB FAQ v02r01

## 5. MEASUREMENT RESULTS

### 5.1 Transmission time

#### 5.1.1 Standard Applicable [FCC §15.519(a) & RSS-220 5.3.1(b)]

A UWB device operating under the provisions of this section shall transmit only when it is sending information to an associated receiver. The UWB intentional radiator shall cease transmission within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB intentional radiator at least every 10 seconds or the UWB device must cease transmitting.

#### 5.1.2 Test Environment conditions

- Ambient temperature : (22 ~ 23) °C • Relative Humidity : (43 ~ 45) % R.H.

#### 5.1.3 Measurement Procedure

For test purpose the UWB port of the EUT is connected with the spectrum analyzer through a RF cable. The UWB receiver is located close by EUT.

The measurement is made in time domain by the central frequency of the channel. Measurement duration 20 s. RBW = 1 MHz.

It is checked, whether the EUT transmits, when the UWB receiver is switched on. After 10 s the intentional radiator is switched off. And it will be checked, whether the EUT continues to transmit and if so then how long.

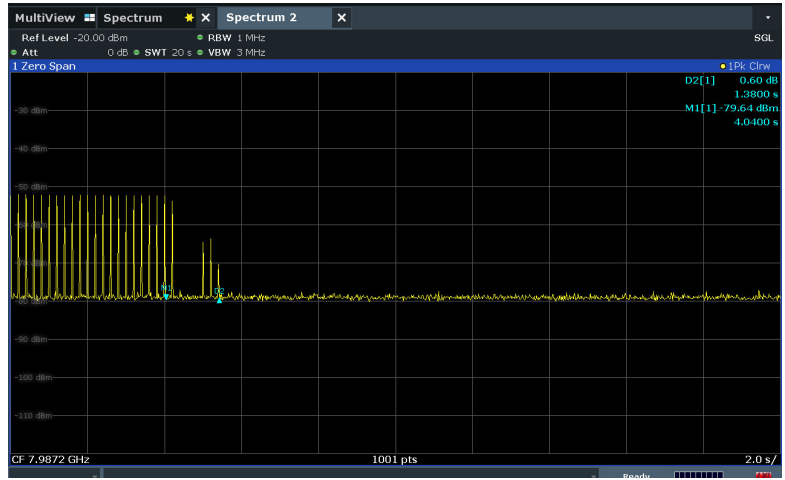

#### 5.1.4 Test setup

#### 5.1.5 Measurement Result

Frequency(MHz)	Measurement result(s)	Limit(s)	Result
7 987.2	1.38	10	Compliance

5.1.6 Test Plot

## 5.2 UWB Bandwidth Measurement

### 5.2.1 Standard Applicable [ FCC §15.503(a), 15.519(b) & RSS-220 5.1(a)]

Ultra-wideband (UWB) transmitter. An intentional radiator that, at any point in time, has a fractional bandwidth equal to or greater than 0.20 or has a UWB bandwidth equal to or greater than 500 MHz, regardless of the fractional bandwidth. The UWB bandwidth of a device operating under the provisions of this section must be contained between 3100 MHz and 10,600 MHz.

### 5.2.2 Test Environment conditions

- Ambient temperature : (21 ~ 22) °C
- Relative Humidity : (42 ~ 43) % R.H.

### 5.2.3 Measurement Procedure

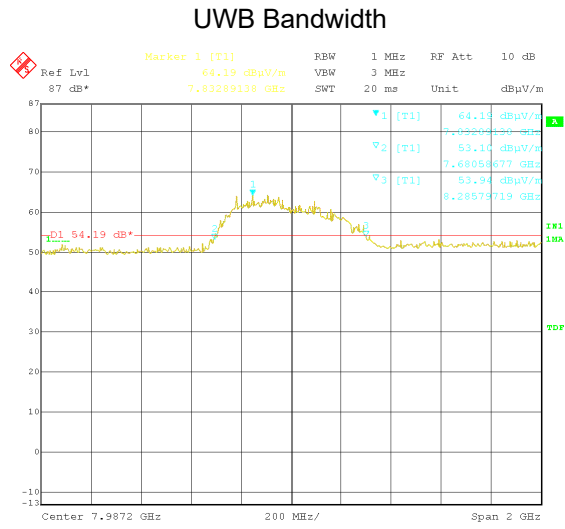

The frequency at which the maximum power level is measured with the peak detector is designated  $f_M$  (RBW=1 MHz, VBW= 3 MHz, peak detection, maxhold). The outermost 1 MHz segments above and below  $f_M$ , where the peak power falls by 10 dB relative to the level at  $f_M$ , are designated as  $f_H$  and  $f_L$ . The UWB transmission, and the -10 dB bandwidth (B - 10), is defined as ( $f_H - f_L$ ). -10 dB bandwidth should be  $\geq 500$  MHz and must be contained between 3100 MHz and 10.600 MHz.

### 5.2.4 Measurement Result

The frequency at which the maximum power $f_M$ [MHz]	Power of the frequency $f_M$ [dBuV]	$f_L$ [MHz]	$f_H$ [MHz]	-10 dB bandwidth [MHz]
7 832	64.19	7 681	8 286	605

For a UWB device emission spectrum, the entire fundamental bandwidth (that portion of the spectrum between the outermost -10 dB points) must be fully contained within the authorized frequency band (3 100 MHz and 10 600 MHz). As stated Q3 of KDB 393764 D01 UWB FAQ v02r01

5.2.6 Test Plot

### 5.3 Spurious RF Radiated emissions

#### 5.3.1 Standard Applicable [ FCC §15.519(c), 15.209 & RSS-GEN 8.9, RSS-220 5.3(d)]

The radiated emissions at or below 960 MHz from a device operating under the provisions of this section shall not exceed the emission levels in § 15.209.

§15.209 limits for radiated emissions measurements (distance at 3 m)

Frequency Band [MHz]	DISTANCE [Meters]	Limit [ $\mu\text{V}/\text{m}$ ]	Limit [ $\text{dB}\mu\text{V}/\text{m}$ ]
0.009 ~ 0.490	300	2400/F(kHz)	67.6-20log(F)
0.490 ~ 1.705	30	24000/F(kHz)	87.6-20log(F)
1.705 ~ 30.0	30	30	29.54
30 - 88	3	100 **	40.00
88 - 216	3	150 **	43.52
216 - 960	3	200 **	46.02
Above 960	3	500	54.00

\*\* fundamental emissions from intentional radiators operation under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz, or 470-806 MHz. However, operation within these Frequency bands is permitted under other sections of this Part Section 15.231 and 15.241

The radiated emissions above 960 MHz from a device operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of 1 MHz:

§15.519(c)

Frequency Band [MHz]	EIRP[dBm]	E-Field[dBuV/m] at 3 m	E-Field[dBuV/m] at 1 m
960-1 610	-75.3	19.9	29.5
1 610-1 990	-63.3	31.9	41.5
1 990-3 100	-61.3	33.9	43.5
3 100-10 600	-41.3	53.9	63.5
Above 10 600	-61.3	33.9	43.5

Note 1: This may be converted to a peak field strength level at 3 meters using  $E(\text{dBuV}/\text{m}) = P(\text{dBm EIRP}) + 95.2$

Note 2: Above 960 MHz shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from 3m to 1m. Distance extrapolation factor =  $20 \log(\text{specific distance [3m]} / \text{test distance [1m]})$  (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [9.54 dB]

From 47 CFR Section 15.519(c): Emissions from digital circuitry used to enable the operation of the UWB transmitter shall comply with the limits in Section 15.209 of this chapter, rather than the limits specified in this subpart, provided it can be clearly demonstrated that those emissions from the UWB device are due solely to emissions from digital circuitry contained within the transmitter and that the emissions are not intended to be radiated from the transmitter's antenna. Emissions from associated digital devices, as defined in Section 15.3(k) of this chapter, e.g., emissions from digital circuitry used to control additional functions or capabilities other than the UWB transmission, are subject to the limits contained in Subpart B of Part 15 of this chapter.

### 5.3.2 Test Environment conditions

- Ambient temperature : (21 ~ 22) °C • Relative Humidity : (42 ~ 43) % R.H.

### 5.3.3 Measurement Procedure

1. Configure the EUT according to ANSI C63.4. The EUT was placed on the top of the turntable 0.8 meter above ground. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 3 meters far away from the turntable for measured the frequency range below 960 MHz and antenna tower was placed below 1 meters far away from the turntable for measured the frequency range above 960 MHz.
2. Power on the EUT and all the supporting units. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
3. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization.
4. For each suspected emissions, the antenna tower was scan (from 1 M to 4 M) and then the turntable was rotated (from 0 degree to 360 degrees) to find the maximum reading.
5. The measurements made over the frequency range from 9 kHz to 960 MHz were maximized using an EMI receiver with peak detector capabilities. Measurements of the radiated field from 9 kHz to 960 MHz were made with the measurement antenna located a distance of 3 meters from the EUT. If the emissions level of the EUT in peak mode was 3 dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 3 dB margin will be repeated one by one using the quasi-peak method for below 1GHz.
6. Measurements above 960 MHz were maximized using a spectrum analyzer with RMS detector capabilities. A spectrum analyzer was used for the final measurements utilizing an RMS detector at the frequencies with the largest amplitudes. The prescribed RBW of 1 MHz and VBW of 3 MHz, and a1 msec averaging time were used for these measurements. Measurements of the radiated field at frequencies above 960 MHz were made with the measurement antenna located a distance of below 1 meter from the EUT.
7. The spectrum between 9 kHz and 960 MHz contained no intentional radiation and lies below the limits. The spectrum from 960MHz to18GHz contained intentional UWB signals between 3100 MHz and 10600 MHz and lie below the limits. No other emissions above 10600 MHz were detected. The maximum frequency tested was 40 GHz.
8. Per 47 CFR, Part 15, Subpart F, §15.521(c) (§15.209) all digital emissions from the transmitter not intended to be radiated from the antenna port meet the 15.209 subpart C limits.
9. Additional measurements in the 960 MHz to 40 GHz range were performed to determine the nature of all unintentional emissions in this span. Conducted antenna port measurement and terminated antenna port measurement were done in the 960 MHz to 8 GHz range show that all noise peaks have the same frequency and polarization and are determined to be emission from the digital circuit and are not radiated from the antenna.
10. All radiated tests for above 1GHz utilized a one-meter separation distance between the DUT and the measurement antenna. This enabled an improved signal-to-noise ratio (S/N) for the radiated tests. Although these types of measurements are typically performed at a distance of three-meters, it was necessary to reduce the measurement distance to enable discrimination between the emissions radiating from the DUT and the measurement system noise floor.

### 5.3.4 Measurement Uncertainty

The measurement uncertainties shown below were calculated in accordance with the requirements of ANSI C63.10-2013. All measurement uncertainty values are shown with a coverage factor of  $k = 2$  to indicate a 95% level of confidence. The measurement uncertainty shown below meets or exceeds the UCISPR measurement uncertainty values specified in CISPR 16-4-2 and, thus, can be compared directly to specified limits to determine compliance.

Radiated Emission measurement: Below 1 GHz: 3.80 dB (CL: Approx 95 %,  $k=2$ )  
Above 1 GHz: 3.42 dB (CL: Approx 95 %,  $k=2$ )

### 5.3.5 Test Configuration

Radiated emission setup, below 30 MHz

Radiated emission setup, below 1 000 MHz

Radiated emission setup, above 1 GHz

### 5.3.6 Measurement Result

## 5.4 Radiated Emissions in GPS Bands Measurement

### 5.4.1 Standard Applicable [FCC §15.519(d) & RSS-220 5.3(e)]

In addition to the radiated emission limits specified in the table in paragraph (c) of this section, UWB transmitters operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of no less than 1 kHz:

Frequency Band [MHz]	EIRP[dBm]	E-Field[dBuV/m] at 3 m	E-Field[dBuV/m] at 1 m
1 164-1 240	-85.3	9.9	19.44
1 559-1 610	-85.3	9.9	19.44

Note 1: This may be converted to a peak field strength level at 3 meters using  $E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2 \text{ dB}$ .

Note 2: Above 960MHz shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from 3m to 1m. Distance extrapolation factor =  $20 \log(\text{specific distance [3m]} / \text{test distance [1m]})$  (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [9.54 dB].

Note 3: Above 960MHz shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from 3m to 1m. Distance extrapolation factor =  $20 \log(\text{specific distance [3m]} / \text{test distance [1m]})$  (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [9.54 dB]. from 3m to 0.5m. Distance extrapolation factor =  $20 \log(\text{specific distance [3m]} / \text{test distance [0.5m]})$  (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [15.56 dB]

### 5.4.2 Test Environment conditions

- Ambient temperature : (21 ~ 22) °C • Relative Humidity : (42 ~ 43) % R.H.

### 5.4.3 Measurement Procedure

1. Configure the EUT according to ANSI C63.4. The EUT was placed on the top of the turntable 0.8 meter above ground. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 1 meters far away from the turntable.
2. Power on the EUT and all the supporting units. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
3. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization.
4. For each suspected emissions, the antenna tower was scan (from 1 M to 4 M) and then the turntable was rotated (from 0 degree to 360 degrees) to find the maximum reading.
5. Measurements frequencies were maximized using a spectrum analyzer with RMS detector capabilities. A spectrum analyzer was used for the final measurements utilizing an RMS detector at the frequencies with the largest amplitudes. The prescribed RBW of 1 kHz and VBW of 1 kHz, and a 1 msec averaging time were used for these measurements.
6. Per 47 CFR, Part 15, Subpart F, §15.521© (§15.209) all digital emissions from the transmitter not intended to be radiated from the antenna port meet the 15.209 subpart C limits.
7. All radiated tests for above 1GHz utilized a one-meter separation distance between the DUT and the measurement antenna. This enabled an improved signal-to-noise ratio (S/N) for the radiated tests. Although these types of measurements are typically performed at a distance of three-meters, it was necessary to reduce the measurement distance to enable discrimination between the emissions radiating from the DUT and the measurement system noise floor.

### 5.4.5 Measurement Result

## 5.5 Peak Emissions within a 50 MHz Bandwidth Measurement

### 5.4.1 Standard Applicable [ FCC §15.519(e)/15.521(g) & RSS-210 5.3(g)]

**15.519(e)** There is a limit on the peak level of the emissions contained within a 50 MHz bandwidth centered on the frequency at which the highest radiated emission occurs,  $f_M$ . That limit is 0 dBm EIRP. It is acceptable to employ a different resolution bandwidth, and a correspondingly different peak emission limit.

**15.521(g)** When a peak measurement is required, it is acceptable to use a resolution bandwidth other than the 50 MHz specified in this subpart. This resolution bandwidth shall not be lower than 1 MHz or greater than 50 MHz, and the measurement shall be centered on the frequency at which the highest radiated emission occurs,  $f_M$ . If a resolution bandwidth other than 50 MHz is employed, the peak EIRP limit shall be  $20 \log(\text{RBW}/50)$  dBm where RBW is the resolution bandwidth in megahertz that is employed. This may be converted to a peak field strength level at 3 meters using  $E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2$ . If RBW is greater than 3 MHz, the application for certification filed with the Commission must contain a detailed description of the test procedure, calibration of the test setup, and the instrumentation employed in the testing.

Peak EIRP Limit [dBm] (RBW: 50 MHz)	Peak EIRP Limit [dBm] (RBW: 10 MHz)	E-Field [dBuV/m] at 3 m (RBW: 10 MHz)	E-Field [dBuV/m] at 1 m (RBW: 10 MHz)
0	-13.98	81.22	90.76

EIRP limit has to be adjusted by the resolution bandwidth ratio of  $20\log(\text{RBW}/50)$  dB, where RBW is the resolution bandwidth used for the measurement expressed in MHz. In addition, This may be converted to a peak field strength level at 3 meters using  $E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2$  dB. And Peak emission shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from 3m to 1m. Distance extrapolation factor =  $20 \log(\text{specific distance [3m]} / \text{test distance [1m]})$  (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [9.54 dB]

### 5.4.2 Test Environment conditions

- Ambient temperature : (21 ~ 22) °C
- Relative Humidity : (42 ~ 43) % R.H.

### 5.4.3 Measurement Procedure

1. The EUT was placed on the top of the turntable 0.8 meter above ground. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 1 meters far away from the turntable.
2. The horn receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization.
3. For maximum peak emission amplitude, the antenna tower was scan (from 1 M to 4 M) and then the turntable was rotated (from 0 degree to 360 degrees) to find the maximum reading and was used to determine the frequency at which the highest radiated emission occurs,  $f_M$ .
4. The individual UWB bandwidths were measured for each BAND\_ID (nb) of the UWB spectrum. Both horizontal and vertical polarizations were taken into account to determine the full UWB BW on the maximized (in azimuth and elevation) signals.
5. A spectrum analyzer was used for the final measurement utilizing a peak detector at the frequency with the largest amplitude. The prescribed resolution bandwidth of 50 MHz was not supported by the spectrum analyzer. However, when a peak measurement is required, The resolution bandwidth for this measurement was set to 8 MHz, and the measurement was centered on the frequency at which the highest radiated emission occurred,  $f_M$ . The video bandwidth was 10 MHz.
6. All radiated tests for above 1GHz utilized a one-meter separation distance between the DUT and the measurement antenna. This enabled an improved signal-to-noise ratio (S/N) for the radiated tests. Although these types of measurements are typically performed at a distance of three-meters, it was necessary to reduce the measurement distance to enable discrimination between the emissions radiating from the DUT and the measurement system noise floor.

#### Vertical at 1 m

## 5.6 Antenna requirement

### 5.6.1 Standard applicable [FCC §15.203]

For intentional device, according to §15.203, an intentional radiator shall be designed to ensure that no antenna other than furnished by responsible party shall be used with the device.

The use of a permanently attached antenna or of an antenna that user a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

The manufacturer may design the unit so that broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

### 5.6.2 Antenna details

Frequency Band	Antenna Type	Gain [dBi]	Results
6.2~8.24 GHz	7GHz Mini UWB Antenna(SMD)	2.0	Compliance

## 5.7 AC Power Conducted emissions

### 5.7.1 Standard Applicable [FCC §15.207(a)]

For intentional radiator that is designed to be connected to the public utility(AC)power line, the radio frequency. Voltage that is conducted back onto the AC power line on any frequencies hopping mode within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50  $\mu$ H/50 ohms line Impedance stabilization network(LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

§15.207 limits for AC line conducted emissions;

Frequency of Emission(MHz)	Conducted Limit (dB $\mu$ V)	
	Quasi-peak	Average
0.15 ~ 0.5	66 to 56 *	56 to 46 *
0.5 ~ 5	56	46
5 ~ 30	60	50

\* Decreases with the logarithm of the frequency

### 5.7.2 Test Environment conditions

• Ambient temperature : (N/A) °C • Relative Humidity : (N/A) % R.H.

### 5.7.3 Measurement Procedure

EUT was placed on a non- metallic table height of 0.8 m above the reference ground plane. Cables connected to EUT were fixed to cause maximum emission. Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the Maximum signal strength.

### 5.7.4 Used equipment

Equipment	Model No.	Serial No.	Manufacturer	Next cal date	Cal interval	Used
Test receiver	ESCS30	100111	Rohde & Schwarz	2024. 01. 10.	1 year	<input type="checkbox"/>
Pulse Limiter	ESH3-Z2	100097	Rohde & Schwarz	2024. 01. 10.	1 year	<input type="checkbox"/>
LISN	ESH2-Z5	100044	R&S	2024. 01. 10.	1 year	<input type="checkbox"/>
	ESH3-Z5	100147	R&S	2024. 01. 10.	1 year	<input type="checkbox"/>

\*Test Program: " ESXS-K1 V2.2"

#### Measurement uncertainty

The measurement uncertainties shown below were calculated in accordance with the requirements of ANSI C63.10-2013. All measurement uncertainty values are shown with a coverage factor of  $k = 2$  to indicate a 95% level of confidence. The measurement uncertainty shown below meets or exceeds the UCISPR measurement uncertainty values specified in CISPR 16-4-2 and, thus, can be compared directly to specified limits to determine compliance.

0.009 kHz ~ 30 MHz(L) : 3.94 dB(CL: Approx 95 %,  $k=2$ )

0.009 kHz ~ 30 MHz(N) : 3.32 dB(CL: Approx 95 %,  $k=2$ )

### 5.7.5 Measurement Result

- N/A: This EUT is powered by the battery only, this test item is not applicable.

Freq.	Factor [dB]		POL	QP			CISPR AV		
	LISN	CABLE +P/L		Limit	Reading	Result	Limit	Reading	Result
[MHz]				[dB $\mu$ V]	[dB $\mu$ V]	[dB $\mu$ V]	[dB $\mu$ V]	[dB $\mu$ V]	[dB $\mu$ V]
-	-	-	-	-	-	-	-	-	-

- \* LISN: LISN insertion Loss, Cable: Cable Loss, P/L:pulse limiter factor
- \* L: Line. Live, N: Line. Neutral
- \* Reading: test receiver reading value (with cable loss & pulse limiter factor)
- \* Result = LISN + Reading
