**Summary:**

The purpose of this report is to evaluate the EUT's 79GHz transmitter for exemption from routine SAR testing.

**EUT:**

Model:	O79V3
FCC ID:	2ATMB-O79V3
IC:	26683-O79V3

Distance (d)	20	cm
--------------	----	----

**$S = (P \times G) / (4 \times \pi \times d^2)$  – used to calculate exposure at "d" cm**

**$EIRP = P \times G$ , measured as field strength**

**$d = \sqrt{(S / (P \times G)) \times 4 \times \pi}$  – used to calculate minimum distance to meet limits**

S = power density (mW/cm<sup>2</sup>)

P = transmitter conducted power (in mW)

G = antenna numeric gain (Numerical)

d = distance to radiation center (cm)

**Limits:**

**FCC Limit according to FCC Part 1.1310**

$10W/m^2 = 1mW/cm^2$

**Complies**

**Note:**

The user's manual will stipulate that a 20cm distance from the user is to be maintained. EIRP values in mW were multiplied by 1.25 to account for a 25% tolerance.

**April 2021 TCB Workshop Training**

# Canada's new localized limits > 6 GHz

- February 2021, Health Canada introduced new localized (basic restrictions and reference levels) PD limits
  - < 30 GHz → harmonized w/ ICNIRP-2020 (averaged over 4-cm<sup>2</sup>)
  - > 30 GHz → spatial peak instead 1 cm<sup>2</sup> average
- New limits are now in effect

**RSS 102, Issue 5, Section 2.5.2**

**2.5.2 Exemption Limits for Routine Evaluation – RF Exposure Evaluation**

RF exposure evaluation is required if the separation distance between the user and/or bystander and the device's radiating element is greater than 20 cm, except when the device operates as follows:

- below 20 MHz<sup>6</sup> and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 1 W (adjusted for tune-up tolerance);
- at or above 20 MHz and below 48 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than  $4.49/f^{0.5}$  W (adjusted for tune-up tolerance), where f is in MHz;
- at or above 48 MHz and below 300 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 0.6 W (adjusted for tune-up tolerance);
- at or above 300 MHz and below 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than  $1.31 \times 10^{-2} f^{0.6834}$  W (adjusted for tune-up tolerance), where f is in MHz;
- at or above 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 5 W (adjusted for tune-up tolerance).

In these cases, the information contained in the RF exposure technical brief may be limited to information that demonstrates how the e.i.r.p. was derived.

ISED Power Density Calculations						
Frequency	EIRP	Antenna Gain	Peak EIRP Power	EIRP +25% Tolerance	Exemption Limit	Result
MHz	mW	Num.	mW	mW	mW	
76.10	76.91	1.00	76.91	96.14	5000.00	PASS
78.50	48.08	1.00	48.08	60.10	5000.00	PASS
80.90	19.23	1.00	19.23	24.04	5000.00	PASS
Antenna Gain set to 1.00, power measurements were performed with radiated method						

**Result:**

The EUT was found to be exempt from routine SAR testing and **COMPLIANT** with FCC and ISED RF exposure requirements.
