Dear Application Examiner,

We are applying for a FCC certification for our QR family dataloggers. We have three sister loggers, Model 1, Model 2 and Model 3. All share the same components except Model 3 has larger package variant of the MCU(more I/O pins), a Bosch BMA400 accelerometer and on Model 3 the temperature sensor also can log humidity. We are aiming that all models can fit under the same FCC ID 2ATTNLOGMOREQR. There are no radios included in the design. There is a coin cell battery, MCU and SPI display, I2C temperature and ambient light sensor and on model 3 the SPI accelerometer. Button functionality is reversed on Model 3 compared to Model 2.

Further info regarding the operational description and differences is included in Operational Description of LogQR.pdf
