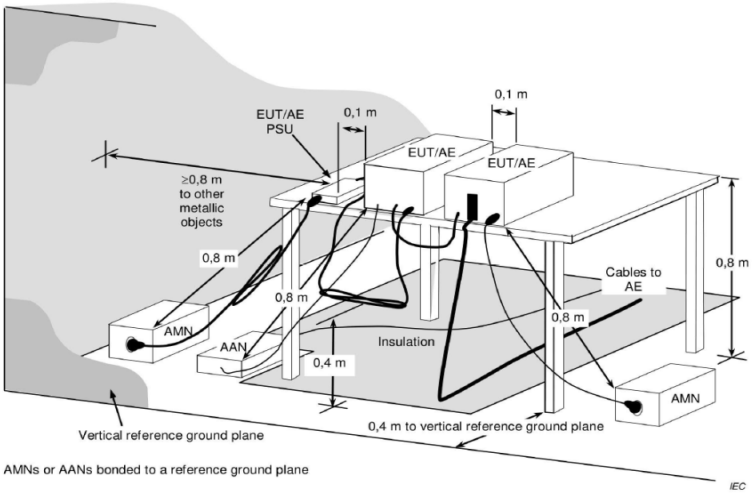
2.2 Test Auxiliary Equipment

Manufacturer	Description	Model	Serial Number
/	/	/	/

2.3 Test Setup

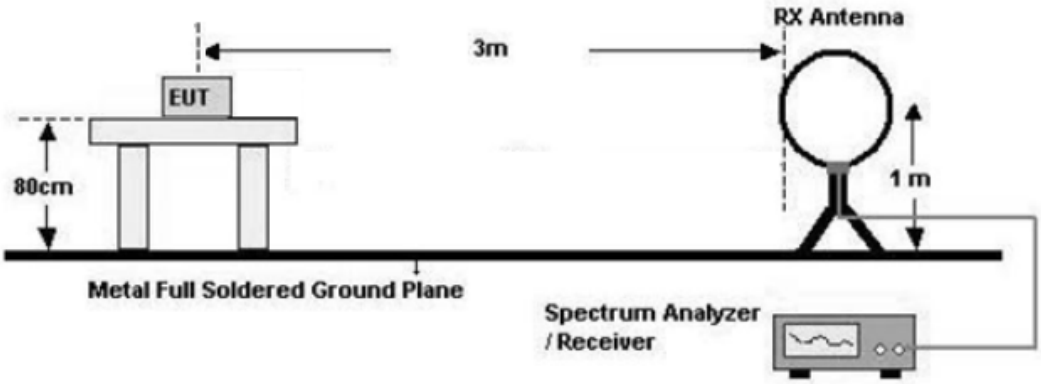
1) Conducted emission measurement:



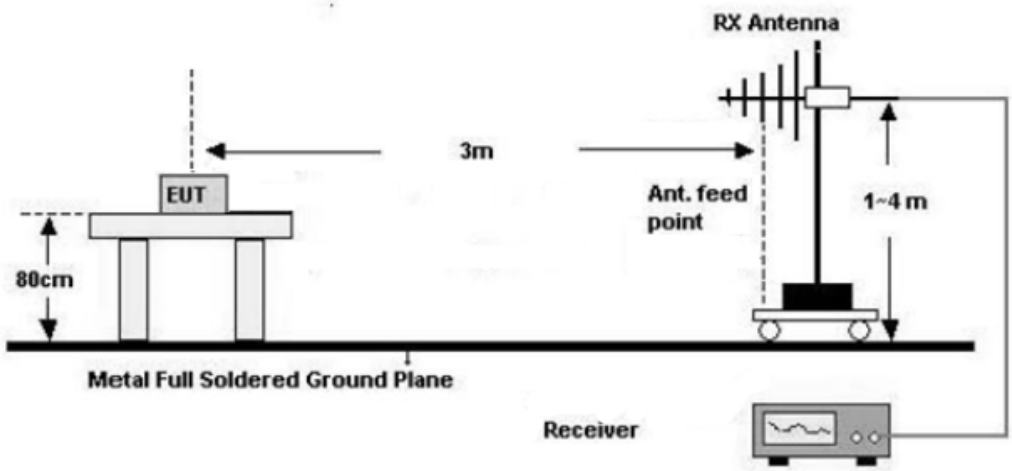
Note: The 0.8 m distance specified between EUT/AE/PSU and AMN/AAN, is applicable only to the EUT being measured. If the device is AE then it shall be >0.8 m.

2) Radiated emission measurement:

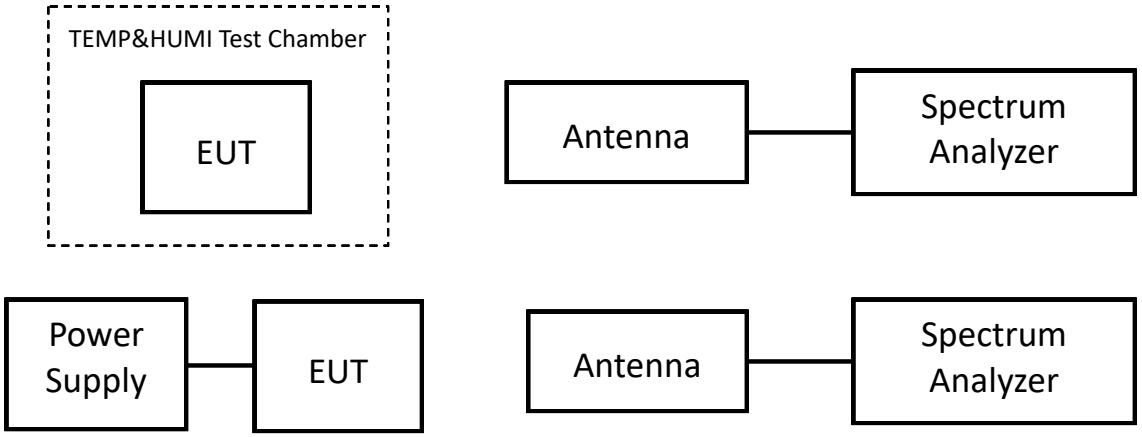
Below 30MHz (3m SAC)



30MHz-1GHz (3m SAC)



3) Frequency Stability Measurement



2.4 Test Procedure

Conducted emission:

1. The E.U.T is placed on a non-conducting table 40cm from the vertical ground plane and 80cm above the horizontal ground plane (Please refer to the block diagram of the test setup and photographs).
2. Both sides of A.C. line are checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.10 on conducted measurement.
3. Line conducted data is recorded for both Line and Neutral

Radiated Emission Procedure:

a) For below 30MHz

1. All measurements were made at a test distance of 3 m. The measured data was extrapolated from the test distance (3m) to the specification distance (300 m from 9-490 kHz and 30 m from 490 kHz- 30 MHz) to clearly show the relative levels of fundamental and spurious emissions and demonstrate compliance with the requirement that the level of any spurious emissions be below the level of the intentionally transmitted signal. The extrapolation factor for the limits were 40*Log (test distance / specification distance).
2. Loop antenna use, investigation was done on the three antenna orientations (parallel, perpendicular, gound-parallel)

b) For 30MHz-1GHz:

1. The EUT was placed on the tabletop of a rotating table 0.8 m the ground at a 3 m semi anechoic chamber. The measurement distance from the EUT to the receiving antenna is 3 m.
2. EUT works in each mode of operation that needs to be tested. The highest signal levels relative to the limit shall be determined by rotating the EUT from 0° to 360° and with varying the measurement antenna height between 1 m and 4 m in vertical and horizontal polarizations..

Bandwidth Test:

1. Use the same setup for radiated 9kHz ~30MHz, found the maximum fundamental level.
2. Change the spectrum analyzer setting for bandwidth testing
3. Test the bandwidth and record the result

Frequency Stability VS temperature Test:

1. The EUT was supply power with normal voltage and placed in the center of the environmental chamber

2. Adjust the location of the measurement antenna to obtain a suitable signal level in measurement instrument

3. Turn off the EUT and set the temperature control on the chamber to the highest specified in the regulatory requirements and allow the chamber temperature to stabilize.

4. While maintaining a constant temperature inside the environmental chamber, turn the EUT ON and record the operating frequency

5. Switch OFF the EUT, Lower the chamber temperature by not more that 10 °C, and allow the

temperature inside the chamber to stabilize

6. Repeat step 4 and step 5 down to the lowest specified temperature

Frequency Stability VS Voltage Test:

1. EUT was placed at ambient room temperature (+15 °C to +25 °C) and connect to a power source which can varying supply voltage

2. Adjust the location of the measurement antenna to obtain a suitable signal level in measurement instrument

3. Varying the supply voltage at 85% and 115% of the nominal supply voltage, record the operating frequency

Remarks: Factor = Antenna factor + Cable loss - Preamp gain

Remark:

Result = Reading + Factor

Factor = Antenna factor + Cable loss – Amplifier gain

Over Limit = Result – Limit

3.5 Frequency Stability Test Data

Test Date:	2023-12-14	Test By:	Luke Li
Environment condition:	Temperature: 22.1°C; Relative Humidity:60%; ATM Pressure: 101.3kPa		

Nominal frequency: 13.56MHz					
Temperature (℃)	Voltage Supplied (V_{DC})	Test Frequency (MHz)	Frequency Error (Hz)	Limit (Hz)	Result
-20	3.87	13.560196	196	±1356	Pass
-10		13.560118	118	±1356	Pass
0		13.560165	165	±1356	Pass
10		13.559923	-77	±1356	Pass
20		13.560020	20	±1356	Pass
25		13.560136	136	±1356	Pass
30		13.559976	-24	±1356	Pass
40		13.560049	49	±1356	Pass
50		13.560142	142	±1356	Pass
20	3.45	13.560057	57	±1356	Pass
	4.45	13.560084	84	±1356	Pass

Note: Frequency error = (Test Frequency – Nominal frequency)/ Nominal frequency*100%

Note: the limit is ±0.01% of center frequency

Center frequency is 13.56MHz, so limit=13.56MHz*(±0.01%)= ±1356Hz
