### 1.3 MEASUREMENT UNCERTAINTY

Measurement Uncertainty
Conducted Emission Expanded Uncertainty $=2.71 \mathrm{~dB}, \mathrm{k}=2$
Radiated emission expanded uncertainty $(9 \mathrm{kHz}-30 \mathrm{MHz})=4.26 \mathrm{~dB}, \mathrm{k}=2$
Radiated emission expanded uncertainty $(30 \mathrm{MHz}-1000 \mathrm{MHz})=3.90 \mathrm{~dB}, \mathrm{k}=2$
Radiated emission expanded uncertainty(Above 1 GHz ) $=4.28 \mathrm{~dB}, \mathrm{k}=2$

## 2. GENERAL INFORMATION

### 2.1 General Description of EUT

| Equipment | Wireless Charger |
| :--- | :--- |
| Model Name | M5 |
| Serial No. | M6 |
| Model Difference | All model's the function, software and electric circuit are the same, only <br> with a product model named different. Test sample model: M5 |
| Trade Mark | N/A |
| FCC ID | 2AUDO-M5 |
| Antenna Type | Coil Antenna |
| Antenna Gain | $0 d B i$ |
| Operation frequency | 125 KHz |
| Number of Channels | 1 |

### 2.3 Operation of EUT during testing <br> Operating Mode <br> The mode is used: Transmitting mode

### 2.4 Description of Test Setup

Operation of EUT during testing:

Adapter information
Model: HW-059200CHQ
Input: 100-240V, $50-60 \mathrm{~Hz}, 0.5 \mathrm{~A}$
Output: 5VDC, 2A
Mobile phone information
Model: Samsung S6

The sample was placed ( $0.8 \mathrm{~m}(30 \mathrm{MHz} \sim 1 \mathrm{GHz}), 0.8 \mathrm{~m}$ above the ground plane of 3 m chamber. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis ( $\mathrm{X}, \mathrm{Y} \& \mathrm{Z}$ ) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating the turntable, varying antenna height from 1 m to 4 m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages. The worst case is X position.

## 3. CONDUCTED EMISSION TEST

### 3.1 Block Diagram of Test Setup

### 3.2 Conducted Power Line Emission Limit

According to FCC Part 15.207(a)

| Frequency <br> (MHz) | Maximum RF Line Voltage (dB $\mu \mathrm{V})$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

| $0.50-5.00$ | 73 | 60 | 56 | 46 |
| $5.00-30.0$ | 73 | 60 | 60 | 50 |

* Decreasing linearly with the logarithm of the frequency

For intentional device, according to $\$ 15.207$ Line Conducted Emission Limit is same as above table.

### 3.3 Test Procedure

1, The equipment was set up as per the test configuration to simulate typical actual usage per the user's manual. The EUT is a tabletop system, a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.10.
2, Support equipment, if needed, was placed as per ANSI C63.10.
3, All I/O cables were positioned to simulate typical actual usage as per ANSI C63.10.
4, If a EUT received DC power from the USB Port of Notebook PC, the PC's adapter received AC120V/60Hz power through a Line Impedance Stabilization Network (LISN) which supplied power source and was grounded to the ground plane.
5, All support equipments received AC power from a second LISN, if any.
6, The EUT test program was started. Emissions were measured on each current carrying line of the EUT using a spectrum Analyzer / Receiver connected to the LISN powering the EUT. The LISN has two monitoring points: Line 1 (Hot Side) and Line 2 (Neutral Side). Two scans were taken: one with Line 1 connected to Analyzer / Receiver and Line 2 connected to a 50 ohm load; the second scan had Line 1 connected to a 50 ohm load and Line 2 connected to the Analyzer / Receiver.
7, Analyzer / Receiver scanned from 150 KHz to 30 MHz for emissions in each of the test modes

## 4. Occupied Bandwidth

### 4.1 Block Diagram of Test Setup

4.2 Rules and specifications

CFR 47 Part 15.215(c)
ANSI C63.10-2013

### 4.3 Test Procedure

Intentional radiators operating under the alternative provisions to the general emission limits, as contained in $\S \S 15.217$ through 15.257 and in subpart E of this part, must be designed to ensure that 20dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equip compliance with the 20 dB attenuation specification may base on measurement at the intentional radiator's antenna output terminal unless the intentional radiator uses a permanently attached antenna, in which case compliance shall be deomonstrated by measuring the radiated emissions.

### 5.3 Test Procedure

## Measurement distance 3 m

For the measurement range up to 30 MHz in the following plots the field strength result from 3 m
Distance measurement are extrapolated to 300 m and 30 m distance respectively, by $40 \mathrm{~dB} / \mathrm{decade}$, According to part 15.31(f)(2), per antenna factor scaling.
Measurements below 1000 MHz are performed with a peak detector and compared to average limits, Measurements with an average detector are not required.
Note:
For battery operated equipment, the equipment tests shall be performed using a new battery.

## 6. ANTENNA REQUIREMENT

## Standard Applicable

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

## Refer to statement below for compliance.

The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

## Antenna Connected Construction

The antenna used in this product is a Coil Antenna which permanently attached. It conforms to the standard requirements. The directional gains of antenna used for transmitting is 0 dBi .
