## RF Exposure Evaluation

Test Requirement:
Evaluation Method:

FCC Part 1.1307
FCC Part 2.1091

## Requirements

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2 m normally can be maintained between the user and the device.

## The procedures / limit

(A) Limits for Occupational / Controlled Exposure

| Frequency Range <br> $(\mathrm{MHz})$ | Electric Field <br> Strength (E) (V/m) | Magnetic Field <br> Strength (H) <br> $(\mathrm{A} / \mathrm{m})$ | Power Density (S) <br> $\left(\mathrm{mW} / \mathrm{cm}^{2}\right)$ | Averaging Time <br> $\|E\|^{2},\|\mathrm{H}\|^{2}$ or S <br> $($ minutes $)$ |
| :---: | :---: | :---: | :---: | :---: |
| $0.3-3.0$ | 614 | 1.63 | $(100)^{\star}$ | 6 |
| $3.0-30$ | $1842 / \mathrm{f}$ | $4.89 / \mathrm{f}$ | $(900 / \mathrm{f})^{\star}$ | 6 |
| $30-300$ | 61.4 | 0.163 | 1.0 | 6 |
| $300-1500$ |  |  | $\mathrm{~F} / 300$ | 6 |
| $1500-100,000$ |  |  | 5 | 6 |

(B) Limits for General Population / Uncontrolled Exposure

| Frequency Range <br> $(\mathrm{MHz})$ | Electric Field <br> Strength (E) $(\mathrm{V} / \mathrm{m})$ | Magnetic Field <br> Strength $(\mathrm{H})$ <br> $(\mathrm{A} / \mathrm{m})$ | Power Density $(\mathrm{S})$ <br> $\left(\mathrm{mW} / \mathrm{cm}^{2}\right)$ | Averaging Time <br> $\|E\|^{2},\|\mathrm{H}\|^{2}$ or $S$ <br> $($ minutes $)$ |
| :---: | :---: | :---: | :---: | :---: |
| $0.3-1.34$ | 614 | 1.63 | $(100)^{*}$ | 30 |
| $1.34-30$ | $824 / \mathrm{f}$ | $2.19 / \mathrm{f}$ | $(180 / \mathrm{f})^{\star}$ | 30 |
| $30-300$ | 27.5 | 0.073 | 0.2 | 30 |
| $300-1500$ |  |  | $\mathrm{~F} / 1500$ | 30 |
| $1500-100,000$ |  |  | 1.0 | 30 |

Note: $\mathrm{f}=$ frequency in MHz ; *Plane-wave equivalent power density

## MPE Calculation Method

$\mathbf{P}=$ Peak RF output power (W)
$\mathbf{G}=$ EUT Antenna numeric gain (numeric)
$\mathbf{R}=$ Separation distance between radiator and human body $(m)=0.2 m$
The formula can be changed to
Pd $=P_{\text {out }}{ }^{*} \mathrm{G} /\left(4 * \mathrm{Pi}^{*} \mathrm{R}^{2}\right)$
From the peak EUT RF output power, the minimum mobile separation distance, $\mathrm{d}=0.2 \mathrm{~m}$, as well as the gain of the used antenna, the RF power density can be obtained.

| Antenna <br> Gain (dBi) | Antenna Gain <br> (numeric) | Max. Peak <br> Output <br> Power (dBm) | Peak Output <br> Power $(\mathrm{mW})$ | Power Density <br> $(\mathrm{mW} / \mathrm{cm} 2)$ | Limit of Power <br> Density <br> $(\mathrm{mW} / \mathrm{cm} 2)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| -1 | 0.79 | 8.78 | 7.55 | 0.0012 | 1 |

Compliance.
