SAR evaluation

MPE Calculation Method
$E(V / m)=(30 * P * G)^{0.5} / \mathrm{d}$
Power Density: Pd (W/m2) $=E^{2} / 377$
E = Electric Field (V/m)
P = Peak RF output Power (W)
G = EUT Antenna numeric gain (numeric)
$\mathrm{d}=$ Separation distance between radiator and human body (m)
The formula can be changed to
$\mathrm{Pd}=\left(30 * \mathrm{P}^{*} \mathrm{G}\right) /\left(377 \mathrm{~A}^{2}\right)$
From the peak EUT RF output power, the minimum mobile separation distance, $\mathrm{d}=0.2 \mathrm{~m}$, as well as the gain of the used antenna, the RF power density can be obtained.

Calculated Result and Limit (WORSE CASE IS AS BELOW)

| Directional <br> AntennaGain <br> (Numeric) | Peak Output <br> Power (mW) | Power Density <br> $(\mathrm{S})(\mathrm{mW} / \mathrm{cm} 2)$ | Limit of Power <br> Density (S) <br> $(\mathrm{mW} / \mathrm{cm2})$ | Test <br> Result |
| :--- | :--- | :--- | :--- | :--- |
| 1.26 (1dBi) | 34.78 <br> $(15.413 \mathrm{dBm})$ | 0.0087 | 1 | Compiles |
