Test Result

The requirements of the tests performed as shown in the overview (clause 4) were fulfilled by the equipment under test. The complete test results are presented in the following.

"Passed" indicates that the equipment under test conforms with the relevant limits of the testing standard without taking any measurement uncertainty into account as stated in clause 1.3 of ANSI C63.10 (2013). However, the measurement uncertainty is calculated and shown in this test report.

2 Operational States

Description of function of the EUT:

The EUT is a telematic Unit to provide fleet management services & remote diagnostics, allows for remote measurement and also serves as AP-Server for Internet via WiFi.

This test report includes results to show compliance for simultaneous transmission of the RF modules integrated in the EUT.

The following states were defined as the operating conditions:

The EUT was supplied by 24 V DC during all tests.

During all tests, the EUT was connected over WLAN 5 GHz to a CMW500 and an iperf client/server was established to simulate a continuous data load.

The EUT was also connected via WLAN 2.4 GHz to a WLAN router via a test laptop and an iperf server/client connection was established to simulate a continuous data load.

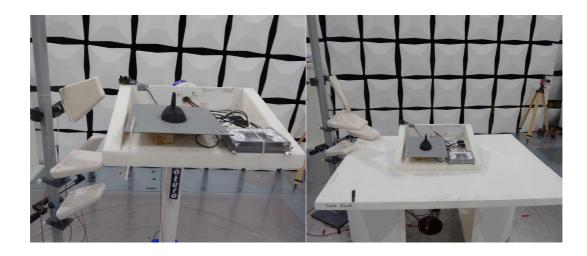

For the Bluetooth operation a Bluetooth USB dongle provided by the applicant has been used to connect to the EUT and a load has been simulated between the Dongle and the EUT.

For the cellular part, a connection over the air has been established between the EUT and an additional CMW500.

The following modes have been defined by the applicant to represent the worst-case scenarios for simultaneous transmission:

| Mode 1 | GSM850 + WLAN 5GHz (5785MHz) + WLAN2.4G mode b + BT classic (hopping) + GNSS |
|--------|--|
| Mode 2 | PCS1900 + WLAN 5GHz (5785M) + WLAN2.4G mode b + BT classic (hopping) + GNSS |
| Mode 3 | LTE Bd7 + WLAN 5GHz (5785M) + WLAN2.4G mode b + BT classic (hopping) + GNSS |

The system was setup as follows:

5 Results

5.1 Test setups

5.1.1 Radiated: 30 MHz to 1 GHz

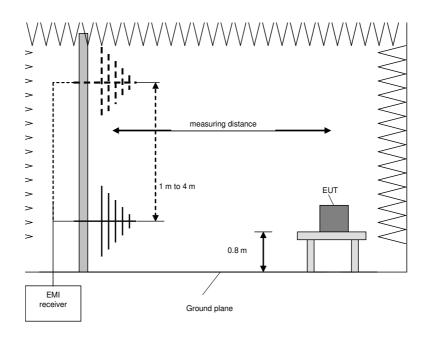

5.1.1.1 Preliminary and final measurement 30 MHz to 1 GHz

The preliminary and final measurements are performed in a semi-anechoic chamber with a metal ground plane at a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

During the tests the EUT is rotated in the range of 0 $^{\circ}$ to 360 $^{\circ}$, the measuring antenna is set to horizontal and vertical polarization and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI receiver is set to the following values:

| Test | 1411 19 11 91 1141 1 | | Resolution bandwidth | Measuring time | Detector |
|-------------------------|----------------------|--------|----------------------|-------------------|-----------------|
| Preliminary measurement | 30 MHz to 1 GHz | 30 kHz | 120 kHz | - | Peak Average |
| Frequency peak search | ± 120 kHz | 10 kHz | 120 kHz | 1 s | Peak |
| Final measurement | 30 MHz to 1 GHz | - | 120 kHz | 1 s | QuasiPeak |

 Page 12 of 29

Procedure preliminary measurement:

The following procedure is used:

- 1) Set the measuring antenna to 1 m height.
- 2) Monitor the frequency range at horizontal polarization of the measuring antenna and an EUT / turntable azimuth of 0 °.
- 3) Rotate the EUT by 360° to maximize the detected signals.
- 4) Repeat steps 2 to 3 with the vertical polarization of the measuring antenna.
- 5) Increase the height of the measuring antenna for 0.5 m and repeat steps 2 to 4 until the final height of 4 m is reached.
- 6) The highest values for each frequency are saved by the software, including the measuring antenna height and polarization and the turntable azimuth for that value.

Procedure final measurement:

The following procedure is used:

- 1) Select the highest frequency peaks (lowest margin to the limit) for the final measurement.
- 2) The software determines the exact peak frequencies by doing a partial scan with reduced step size of the pre-scan of the selected peaks.
- 3) If the EUT is portable or ceiling mounted, find the worst-case EUT orientation (x, y, z) for the final test.
- 4) The worst-case measuring antenna height is found via varying the height by ± 0.5 m from the value obtained in the preliminary measurement while monitoring the emission level.
- 5) The worst-case turntable position is found via varying the turntable azimuth by $\pm 30^{\circ}$ from the value obtained in the preliminary measurement while monitoring the emission level.
- 6) The final measurement is performed at the worst-case measuring antenna height and the worst-case turntable azimuth.
- 7) Steps 2 to 6 are repeated for each frequency peak selected in step 1.

5.1.2 Radiated: 1 GHz to 40 GHz

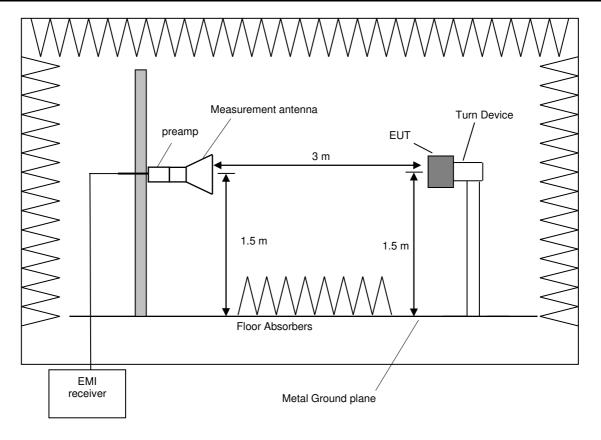

5.1.2.1 Preliminary and final measurement 1 to 40 GHz

The preliminary and final measurements are performed in a semi-anechoic chamber at a measuring distance of 3 meters, with floor absorbers between EUT and measuring antenna. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

During the tests the EUT is rotated in the range of 0 ° to 360 °, the measuring antenna is set to horizontal and vertical polarization and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions. While changing the height, the measuring antenna gets tilted so that it is always aiming at the EUT.

The resolution bandwidth of the EMI receiver is set to the following values:

| Test | est Frequency range Step | | Resolution bandwidth | Measuring time | Detector |
|-------------------------|--------------------------|---------|----------------------|----------------|-----------------|
| Preliminary measurement | 1 - 40 GHz | 250 kHz | 1 MHz | - | Peak Average |
| Frequency peak search | + / - 1 MHz | 50 kHz | 1 MHz | 100 ms | Peak |
| Final measurement | 1 - 40 GHz | - | 1 MHz | 100 ms | Peak Average |

 Tested by:
 Y. KHALEK

Position of EUT: For tests for f between 30 MHz to 1 GHz, the EUT was set-up on a table with a height

of 80 cm. The distance between EUT and antenna was 3 m.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the

annex A in the test report.

Test record: Plots for each frequency range are submitted below.

Remark: None.

Calculations:

Result [$dB\mu V/m$] = Reading [$dB\mu V$] + Correction [$dB\mu V/m$]

Correction $[dB\mu V/m] = AF [dB/m] + Cable attenuation [dB] + optional preamp gain [dB]$

 $Margin \ [dB] = \qquad \qquad Limit \ [dB\mu V/m] - Result \ [dB\mu V/m]$

The measured points and the limit line in the following diagrams refer to the standard measurement of the emitted interference in compliance with the above-mentioned standard. The measured points marked with "\circ" are the measured results of the standard subsequent measurement in a semi-anechoic chamber.

5.2.2 Test results (1 to 40 GHz)

| Ambient temperature: | 23 °C |
|----------------------|-------|
| Relative humidity: | 41 % |

 Date:
 14-15.09.2023

 Tested by:
 Y. KHALEK

Position of EUT: For tests for f between 1 GHz and the 10th harmonic, the EUT was set-up on a

positioner device with a height of 150 cm. The distance between EUT and antenna

was 3 m.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the

annex A in the test report.

Test record: Plots for each frequency range are submitted below.

Remark: None

Calculation:

Max Peak [dB μ V/m] = Reading [dB μ V] + Correction [dB μ V/m] Average [dB μ V/m] = Reading [dB μ V] + Correction [dB μ V/m]

Correction [dBμV/m] = AF [dB/m] + Cable attenuation [dB] + optional preamp gain [dB]+DCCF* [dB]

* (if applicable - only for Average values, that are fundamental related)

Margin [dB] = Limit [dB μ V/m] – Max Peak | Average [dB μ V/m]

The curves in the diagrams only represent the maximum measured value for each frequency point of all preliminary measurements, which were carried out with various EUT and antenna positions.

The top measured curve represents the peak measurement. The measured points marked with "\$\sigma\$" are frequency points for the final peak detector measurement. These values are indicated in the following table. The bottom measured curve represents the average measurement. The measured points marked with "\$\sigma\$" are frequency points for the final average detector measurement.
