## Maximum Permissible Exposure

# 1. Applicable Standards

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2m normally can be maintained between the user and the device.

### **1.1. Limits for Maximum Permissible Exposure (MPE)**

| r          |                |                |                   |  |

Note: f=frequency in MHz; \*Plane-wave equivalent power density

#### **1.2. MPE Calculation Method**

$$E (V/m) = \frac{\sqrt{30 \times P \times G}}{d}$$
 Power Density: Pd (W/m<sup>2</sup>) =  $\frac{E^2}{377}$   
E = Electric Field (V/m)  
P = Peak RF output Power (W)  
G = EUT Antenna numeric gain (numeric)  
d = Separation distance between radiator and human body (m)  
The formula can be changed to

 $Pd = \frac{30 \times P \times G}{377 \times d^2}$ 

From the peak EUT RF output power, the minimum mobile separation distance, d=0.2m, as well as the gain of the used antenna, the RF power density can be obtained

# 2. Conducted Power Result
