Testing the Future

Nalloy, LLC

TEST REPORT FOR

H8J8DL

Tested to The Following Standards:

FCC Part 15 Subpart C Section(s)

15.207 & 15.225 (13.110-14.010MHz)

Report No.: 107516-39

Date of issue: December 21, 2022

Test Certificate # 803.01

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

This report contains a total of 48 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

DATE OF EQUIPMENT RECEIPT: October 13, 2022

DATE(S) OF TESTING: October 13 & 19, 2022

December 8, 2022

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the equipment provided by the client, tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S): CKC Laboratories, Inc. 22116 23rd Drive S.E. Suite A Bothell, WA 98021

SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart C - 15.225

Test Procedure	Description	Modifications	Results
15.215(c)	Occupied Bandwidth	NA	Pass
15.225(a)-(c)	Field Strength of Fundamental	NA	Pass
15.225(e)	Frequency Stability	NA	Pass
15.225(d)	Field Strength of Spurious Emissions	NA	Pass
15.207	AC Conducted Emissions	NA	Pass

NA = Not Applicable

ISO/IEC 17025 Decision Rule

The declaration of pass or fail herein is based upon assessment to the specification(s) listed above, including where applicable, assessment of measurement uncertainties. For performance related tests, equipment was monitored for specified criteria identified in that section of testing.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

,	 	0	
Summary of Conditions			
No modifications were made during testing.			

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions		
None		

Page 5 of 48 Report No.: 107516-39

EQUIPMENT UNDER TEST (EUT)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 1

Equipment Tested:

Device	Manufacturer	Model #	S/N
None	Nalloy LLC, Amazon retail LLC	H8J8DL	NA

Support Equipment:

Device	Manufacturer	Model #	S/N
POE Injector	Cudy	POE350	NA
Laptop	НР	14-fq0032od	NA
USB to Ethernet Dongle	Amazon Basics	USB 3.0 to 10/100/1000	NA
		Gigabit Ethernet Adapter	

Configuration 2

Equipment Tested:

Device	Manufacturer	Model #	S/N
None	Nalloy LLC, Amazon retail LLC	H8J8DL	NA

Support Equipment:

Device	Manufacturer	Model #	S/N
POE Injector	Allnet	ALL048900V2	NA
AC Adapter (for POE Injector)	Fuyuang	FY5502000	NA
Laptop	НР	14-fq0032od	NA
USB to Ethernet Dongle	Amazon Basics	USB 3.0 to 10/100/1000	NA
		Gigabit Ethernet Adapter	

General Product Information:

Product Information	Manufacturer-Provided Details			
Equipment Type:	Stand-Alone Equipment			
Modulation Type(s):	NFC, RFID			
Maximum Duty Cycle:	Tested as 100%			
Antenna Type(s) and Gain:	NA			
Antenna Connection Type:	Integral			
Nominal Input Voltage:	120VAC/60Hz			
	IGT FW Version: 2229			
Firmware / Software used for	Wisepad – WPS33.01-41027			
Firmware / Software used for	Baxter - 1.0.62.0			
Test:	RFIdeas configuration utility – 6.0.5			
	Putty – 0.77			

The validity of results is dependent on the stated product details, the accuracy of which the manufacturer assumes full responsibility.

Test Setup/Conditions								
Test Location:	Bothell Lab C3	Bothell Lab C3 Test Engineer:						
Test Method:	ANSI C63.10 (2013)	Test Date(s):	10/19/2022					
Configuration:	1							
Test Setup:	The EUT is on a test bench inside a semi anechoic chamber. Measurements are made at 3m test distance with distance correction applied. 3 x orthogonal antenna polarities investigated, worst case reported. Manufacturer declared the AC mains to be varied on the PoE injector.							

Environmental Conditions						
Temperature (°C)	25	Relative Humidity (%):	45			

Test Data Summary - Voltage Variations								
Frequency (MHz)	Modulation	V _{Minimum} (dBuV/m@3m)	V _{Nominal} (dBuV/m@3m)	V _{Maximum} (dBuV/m@3m)	Max Deviation from V _{Nominal} (dB)			
13.56	NFC/RFID	32.8	32.8	32.8	0.0			

Test performed using operational mode with the highest output power, representing worst case.

Parameter Definitions:

Measurements performed at input voltage Vnominal ± 15%.

Parameter	Value
V _{Nominal} :	120 VAC
V _{Minimum} :	102.00 VAC
V _{Maximum} :	138.00 VAC

Test Data Summary – Radiated Field Strength Measurement								
Frequency (MHz)	Modulation	Ant. Type	Measured Limit (dBuV/m @ 30m) (dBuV/m @ 30		Results			
13.56	NFC/RFID	NA	32.8	≤84	Pass

Tested By: Matt Harrison Sequence#: 4

Software: EMITest 5.03.20

Equipment Tested:

Device	Manufacturer	Model #	S/N	
Configuration 1				

Support Equipment:

Device	Manufacturer	Model #	S/N	
Configuration 1				

Test Conditions / Notes:

Environmental Conditions:

Temperature: 25°C Humidity: 45% Pressure: 101.4kPa

Method: ANSI C63.10 (2013)

Frequency range: 30-1000MHz

Setup:

EUT is setup in a floor-standing configuration. It is connected to a remote POE injector and a laptop via Ethernet

Cables.

Mode 2:

Honeycrisp (Fuji):

Fuji- CPU DDR eMMC Stress

Audio 1kHz Tone on Speaker at 100% Volume

Display Max Brightness USB to Caramel 480Mbps

Honeycrisp (Opal):

No Stress

Caramel:

Ethernet 100Mbps

USB 2.0 x1 12Mbps to Wisepad USB B No Stressor to Baxter

Wisepad:

Connected and powered on

Tap Mode

Page 29 of 48 Report No.: 107516-39

Baxter and Rufus Peripherals:

Ethernet 100Mbps

Prefect- Stressors on CPU DDR eMMC

Solenoid continuously cycling

Position sensor enabled

Audio over speaker playing representative tone

Microphone on and Recording

USB on Baxter Mass Storage devices no cable

USB A to B from Baxter to Caramel No Stressor

Marshall and Burgundy:

Stressed

GPIO Active

LED Toggling Colors

Buddy:

POE Fully loaded and stressed

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $dB\mu V/m$, the spectrum analyzer reading in $dB\mu V$ was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS				
	Meter reading	(dBμV)		
+	Antenna Factor	(dB/m)		
+	Cable Loss	(dB)		
-	Distance Correction	(dB)		
-	Preamplifier Gain	(dB)		
=	Corrected Reading	(dBμV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE				
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING	
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz	
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz	
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz	
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz	
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz	

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
