# FCC TEST REPORT

FCC ID	: 2AVS4-FDT-EVB-WP300
Equipment	: Wireless Power Reference Design
Brand Name	: Fu Da Tong
Model Name	: EVB-WP300
Applicant/ Manufacturer	: Fu Da Tong Technology Co., Ltd 10F5, No.880, Zhongzheng Rd., Zhonghe Dist., New Taipei City, Taiwan, R.O.C.
Standard	: 47 CFR FCC Part 15.209

The product was received on Mar 29, 2019, and testing was started from Apr. 17, 2020 and completed on Apr. 24, 2020. We, SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, would like to declare that the tested sample has been evaluated in accordance with the procedures given in ANSI C63.10-2013 and shown compliance with the applicable technical standards.

The report must not be used by the client to claim product certification, approval, or endorsement by TAF or any agency of government.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, the test report shall not be reproduced except in full.

#### 1.1 Information

### 1.1.1 General Information

Wireless Power Transfer General Information					
Frequency Range	Modulation Mode	Charging Freq. (kHz)	Field Strength (dBuV/m)		
112-205 kHz	FSK	112.554	89.90		
Power Transfer Method	Output power from each primary coil	That may have multiple primary coils	Charging Method		
Magnetic induction and only single primary coil.	30W	No	Client directly contact		
Note 1: Field strength performed peak level at 3m.					

### 1.1.2 Antenna Information

	Antenna Category						
	Equipment placed on the market without antennas						
$\boxtimes$	Integral antenna (antenna permanently attached)						
	Temporary RF connector provided						
	No temporary RF connector provided Transmit chains bypass antenna and soldered temporary RF connector provided for connected measurement. In case of conducted measurements the transmitter shall be connected to the measuring equipment via a suitable attenuator and correct for all losses in the RF path.						
	External antenna (dedicated antennas)

### 3.1.3 Test Procedures

	Test Method	
$\square$	Refer as ANSI C63.10-2013, clause 6.2 for AC power-line conducted emissions.	
$\boxtimes$	If AC conducted emissions fall in operating band, then following below test method confirm final result	t.
	<ul> <li>Accept measurements done with a suitable dummy load replacing the antenna under the followir conditions:</li> <li>(1) Perform the AC line conducted tests with the antenna connected to determine compliance wit FCC 15.207 limits outside the transmitter's fundamental emission band;</li> <li>(2) Retest with a dummy load to determine compliance with FCC 15.207 limits within the transmitter's fundamental emission band.</li> </ul>	-
	<ul> <li>For a device with a permanent antenna operating at or below 30 MHz, accept measurements dor with a suitable dummy load, in lieu of the permanent antenna under the following conditions:</li> <li>(1) Perform the AC line conducted tests with the permanent antenna to determine compliance with the FCC 15.207 limits outside the transmitter's fundamental emission band;</li> <li>(2) Retest with a dummy load in lieu of the permanent antenna to determine compliance with the FCC 15.207 limits within the transmitter's fundamental emission band.</li> </ul>	rith

### 3.1.4 Test Setup

3—EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50  $\Omega$  loads. LISN may be placed on top of, or immediately beneath, reference ground plane.

3.1—All other equipment powered from additional LISN(s).

3.2—A multiple-outlet strip may be used for multiple power cords of non-EUT equipment.

3.3—LISN at least 80 cm from nearest part of EUT chassis.

4—Non-EUT components of EUT system being tested.

5—Rear of EUT, including peripherals, shall all be aligned and flush with edge of tabletop.

6—Edge of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the ground plane.

7—Antenna can be integral or detachable. If detachable, then the antenna shall be attached for this test.

### 3.1.5 Test Result of AC Power-line Conducted Emissions

# 3.2 Transmitter Radiated Emissions

### 3.2.1 Transmitter Radiated Emissions Limit

	Transmitter Radiat	ed Emissions Limit	
Frequency Range (MHz)	Field Strength (uV/m)	Field Strength (dBuV/m)	Measure Distance (m)
0.009~0.490	2400/F(kHz)	48.5 - 13.8	300
0.490~1.705	24000/F(kHz)	33.8 - 23	30
1.705~30.0	30	29	30
30~88	100	40	3
88~216	150	43.5	3
216~960	200	46	3
Above 960	500	54	3

Note 1: Test distance for frequencies at or above 30 MHz, measurements may be performed at a distance other than the limit distance provided they are not performed in the near field and the emissions to be measured can be detected by the measurement equipment. When performing measurements at a distance other than that specified, the results shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade (inverse of linear distance for field-strength measurements, inverse of linear distance-squared for power-density measurements).

Note 2: Test distance for frequencies at below 30 MHz, measurements may be performed at a distance closer than the EUT limit distance; however, an attempt should be made to avoid making measurements in the near field. When performing measurements below 30 MHz at a closer distance than the limit distance, the results shall be extrapolated to the specified distance by either making measurements at a minimum of two or more distances on at least one radial to determine the proper extrapolation factor or by using the square of an inverse linear distance extrapolation factor (40 dB/decade). The test report shall specify the extrapolation method used to determine compliance of the EUT.

Note 3: the frequency bands 9-90 kHz, 110-490 kHz measurements employing an average detector and other below 1GHz measurements employing a CISPR quasi-peak detector.

### 3.2.2 Measuring Instruments

Refer a test equipment and calibration data table in this test report.

#### 3.2.3 **Test Procedures**

	Test Method
$\square$	Refer as ANSI C63.10, clause 6.5 for radiated emissions from 30 MHz to 1 GHz and test distance is 3m.
	Refer as ANSI C63.10, clause 6.4 for radiated emissions from below 30 MHz the frequency bands 9-90 kHz, 110-490 kHz measurements employing an average detector and other below 30MHz measurements employing a CISPR quasi-peak detector. Test distance is 3 m.
	At frequencies below 30 MHz, measurements may be performed at a distance closer than that specified in the requirements; however, an attempt should be made to avoid making measurements in the near field. Pending the development of an appropriate measurement procedure for measurements performed below 30 MHz, when performing measurements at a closer distance than specified, the results shall be following below methods.
	The results shall be extrapolated to the specified distance by making measurements at a minimum of two distances on at least one radial to determine the proper extrapolation factor.
	The results shall be by using the square of an inverse linear distance extrapolation factor (40 dB/decade).
$\square$	For radiated measurement. Loop antenna was rotated about the horizontal and vertical axis and the equipment to be measured and the test antenna shall be oriented to obtain the maximum emitted field strength level.
$\boxtimes$	The any unwanted emissions level shall not exceed the fundamental emission level.
	All amplitude of spurious emissions that are attenuated by more than 20 dB below the permissible value has no need to be reported.
$\square$	KDB 414788 Open-Field Test Sites and Chamber Correlation Justification.
	Based on FCC 15.31 (f) (2): measurements may be performed at a distance closer than that specified in regulations; however, an attempt should be made to avoid making measurements in the near field.
	Open-field site and chamber correlation testing had been performed and chamber measured test result is the worst case test result.

### 3.2.4 Test Setup

Magnetic field tests shall be performed in the frequency range of 9 kHz to 30 MHz using a calibrated loop antenna.

#### 3.3 **Emission Bandwidth**

#### 3.3.1 **Emission Bandwidth Limit**

**Emission Bandwidth Limit** 

N/A

#### 3.3.2 **Measuring Instruments**

Refer a test equipment and calibration data table in this test report.

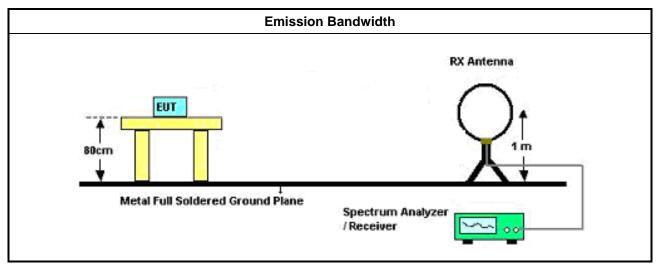

#### 3.3.3 **Test Procedures**

**Test Method** 

 $\square$ Because the measured signal is CW or CW-like adjusting the RBW per C63.10 would not be practical since measured bandwidth will always follow the RBW and the result will be approximately twice the RBW.

For radiated measurement. Loop antenna was rotated about the horizontal and vertical axis and the  $\square$ equipment to be measured and the test antenna shall be oriented to obtain the maximum emitted field strength level.
