Report No.: WH-FCC-R19032702-1

#### 1. General Information

Applicant : Jian Hua technology co., Ltd.

Address : No. 870-12, Datong Road, Datong District, Kaohsiung

**City Taiwan** 

Manufacturer : Jian Hua technology co., Ltd.

Address : No. 870-12, Datong Road, Datong District, Kaohsiung

City Taiwan

EUT : Wireless Solution

Model Name : JH-DPK235159, JH-DPK145159, JH-DPK185159

Model Model Model no.: no.: no.: JH-DPK235 JH-DPK1 JH-DPK 159 45159 185159 **Enclosure Size** Small Big Middle Antenna Gain 14d dBi 18 dBi 23 dBi

Is here with confirmed to comply with the requirements set out in the FCC Rules and Regulations Part 15 Subpart C and the measurement procedures were according to ANSI C63.4-2014. The said equipment in the configuration described in this report shows the maximum emission levels emanating

FCC part 15 subpart E

**Model Differences** 

Receipt Date: 03/27/2019

11年7 粮洪

Final Test Date: 03/19/2020

Mar. 19, 2020

**Date** 

Tested By:

Bing Chang/ Engineer

Mar. 19, 2020

Date Bell Wei / Manager
Designation Number: TW2954

#### 3. Test Configuration of Equipment under Test

#### 3.1 Description of the tested samples

EUT Name : Wireless Solution

Model Number : JH-DPK235159, JH-DPK145159, JH-DPK185159

FCC ID : 2AVW4E53238496

Receipt Date : 03/27/2019

Power From : □Inside ☑Outside RJ45 port

□Adaptor □Battery □AC Power Source

□DC Power Source □Support Unit PC or NB

Power Range : POE

Battery : N/A

Operate Frequency : WiFi:

802.11a, 802.11n HT20: 5745MHz ~ 5825MHz

802.11n HT40: 5755 MHz ~ 5795MHz

Modulation Technique : 802.11a, 802.11n HT20, 802.11n HT40: OFDM

Number of Channels : Refer to the channel list as described below

Antenna Type : Antenna R: Panel Antenna

Antenna L: Panel Antenna

Antenna gain 23 dBi(for Model no.: JH-DPK235159)

18 dBi(for Model no.: JH-DPK185159)

14 dBi(for Model no.: JH-DPK145159)

Page No. : 6 of 113

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

### 3.2 Carrier Frequency of Channels

802.11a, 802.11n,HT20

| Channel | Frequency(MHz) |
|---------|----------------|
| 149     | 5745           |
| 157     | 5785           |
| 165     | 5825           |

802.11n,HT40

| Channel | Frequency(MHz) | Channel | Frequency(MHz) |
|---------|----------------|---------|----------------|
| 151     | 5755           | 159     | 5795           |

Page No. : 7 of 113

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

#### 3.3 Test Mode and Test Software

- a. EUT is power on and connected to PC via RJ45. Log in "10.10.10.10" on website and alter to "10.10.10.10/.rftest". Then we can choose frequency to make sure EUT is continuing trasmitting.
- b. The following test modes were performed for test:
  - 802.11a, 802.11n,HT20: CH149: 5745MHz, CH157: 5785MHz, CH165: 5825MHz
  - 802.11n HT40: CH151: 5755MHz, CH159: 5795MHz

Page No. : 8 of 113

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

3.4 TEST Methodology & General Test Procedures

All testing as described bellowed were performed in accordance with ANSI C63.4:2014

and ANSI C63.10:2013.

**Conducted Emissions** 

The EUT is placed on a wood table, which is at 0.8 m above ground plane acceding to

clause 15.207 and requirements of ANSI C63.4:2014. Conducted emissions from the EUT

measured in the frequency range between 0.15 MHz and 30MHz are using CISPR

Quasi-Peak / Average detectors.

**Radiated Emissions** 

The EUT is a placed on a turn table, which is 0.8 m above ground plane. The turntable was

rotated through 360 degrees to determine the position of maximum emission level. The

EUT is placed at 3m away from the receiving antenna, which varied from 1m to 4m to find

out the highest emission. Each emission was to be maximized by changing the polarization

of receiving antenna both horizontal and vertical.

1) Putting the EUT on the platform and turning on the EUT (on/off button on the bottom

of the EUT).

2) Setting test channel described as "Channel setting and operating condition", and

testing channel by channel.

3) For the maximum output power measurement, we followed the method of

measurement KDB 789033 D02.

4) For the spurious emission test based on ANSI(2014), at the frequency where below

1GHz used quasi-peak detector mode; where above 1GHz used the peak and

average detector mode. IF the peak value may be under average limit, the average

mode will not be performed.

Page No. : 9 of 113

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

#### 3.5 Measurement Uncertainty

| Measurement Item             | Uncertainty |
|------------------------------|-------------|
| Peak Output Power(conducted) | ±1.345dB    |
| Power Spectral Density       | ±1.347dB    |
| Radiated emission(1G-40GHz)  | ±5.00dB     |
| Radiated emission(30M-1GHz)  | ±3.89dB     |
| Conducted emission           | ±1.81dB     |

#### 3.6 Description of the Support Equipments

#### **Setup Diagram**

See test photographs attached in appendix 1 for the actual connections between EUT and support equipment.

#### **Support Equipment**

Peripherals Devices:

|     | OUTSIDE SUPPORT EQUIPMENT |       |            |             |       |            |            |

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

#### 4. Test and measurement equipment

#### 4.1 calibration

The measuring equipment utilized to perform the tests documented in the report has been calibrated once a year or in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

#### 4.2 equipment

The following list contains measurement equipment used for testing. The equipment conforms to the requirement of CISPR 16-1, ANSI C63.2 and. Other required standards.

Calibration of all test and measurement, including any accessories that may effect such calibration, is checked frequently to ensure the accuracy. Adjustments are made and correction factors are applied in accordance with the instructions contained in the respective.

#### 5. Antenna Requirements

#### 5.1 Standard Applicable

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

And according to FCC 47 CFR Section 15.247 (b), if transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi.

#### 5.2 Antenna Construction and Directional Gain

Model no.: JH-DPK235159 Antenna Type: Panel Antenna Antenna Gain: Gain: 23 dBi

Model no.: JH-DPK185159 Antenna Type: Panel Antenna Antenna Gain: Gain: 18 dBi

Model no.: JH-DPK145159 Antenna Type: Panel Antenna Antenna Gain: Gain: 14 dBi

Page No. : 14 of 113

Date of Issue: Mar. 19, 2020

Report No.: WH-FCC-R19032702-1

#### 6. Test of Conducted Emission

#### 6.1 Test Limit

Conducted Emissions were measured from 150 kHz to 30 MHz with a bandwidth of 9 KHz on the 110 VAC power and return leads of the EUT according to the methods defined in ANSI C63.4-2014 Section 3.1. The EUT was placed on a nonmetallic stand in a shielded room 0.8 meters above the ground plane as shown in section 2.2. The interface cables and equipment positioning were varied within limits of reasonable applications to determine the position produced maximum conducted emissions.

| Frequency<br>(MHz) | Quasi Peak<br>(dB µ V) | Average<br>(dB µ V) |
|--------------------|------------------------|---------------------|
| 0.15 – 0.5         | 66-56*                 | 56-46*              |
| 0.5 - 5.0          | 56                     | 46                  |
| 5.0 – 30.0         | 60                     | 50                  |

<sup>\*</sup>Decreases with the logarithm of the frequency.

#### 6.2 Test Procedures

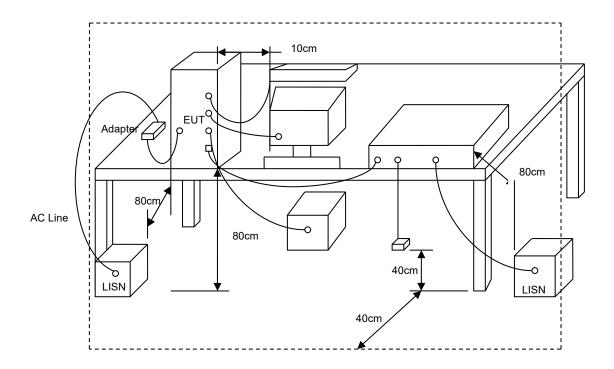

- a. The EUT was placed 0.4 meter from the conducting wall of the shielding room was kept at least 80 centimeters from any other grounded conducting surface.
- b. Connect EUT to the power mains through a line impedance stabilization network (LISN).
- c. All the support units are connecting to the other LISN.
- d. The LISN provides 50 ohm coupling impedance for the measuring instrument.
- e. The FCC states that a 50 ohm, 50 micro-Henry LISN should be used.
- f. Both sides of AC line were checked for maximum conducted interference.
- g. The frequency range from 150 kHz to 30 MHz was searched.
- h. Set the test-receiver system to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

#### 7. Test of Radiated Emission

#### 7.1 Test Limit

In any 100kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. If the transmitter measurement is based on the maximum conducted output power, the attenuation required under this paragraph shall be 30dB instead of 20dB. In addition, radiated emissions which fall in section 15.205(a) the restricted bands must also comply with the radiated emission limit specified in section 15.209(a).

| Frequency<br>(MHz) | Field Strength (microvolt/meter) | Measurement Distance (meters) |
|--------------------|----------------------------------|-------------------------------|
| 0.009 ~ 0.490      | 2400/F(kHz)                      | 300                           |
| 0.490 ~ 1.705      | 24000/F(kHz)                     | 30                            |
| 1.705 ~ 30.0       | 30                               | 30                            |
| 30 ~ 88            | 100                              | 3                             |
| 88 ~ 216           | 150                              | 3                             |
| 216 ~ 960          | 200                              | 3                             |
| Above 960          | 500                              | 3                             |

#### 7.2 Test Procedures

- a. The EUT was placed on a rotatable table top 0.8 meter above ground.
- b. The EUT was set 3 meters from the interference receiving antenna which was mounted on the top of a variable height antenna tower.
- c. The table was rotated 360 degrees to determine the position of the highest radiation.
- d. The antenna is a broadband antenna and its height is varied between one meter and four meters above ground to find the maximum value of the field strength both horizontal polarization and vertical polarization of the antenna are set to make the measurement.
- e. For each suspected emission the EUT was arranged to its worst case and then tune the antenna tower (from 1 M to 4 M) and turn table (from 0 degree to 360 degrees) to find the maximum reading.
- f. Set the test-receiver system to Peak or CISPR quasi-peak Detect Function and specified bandwidth with Maximum Hold Mode.
- g. If the emission level of the EUT in peak mode was 3 dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 3 dB margin will be repeated one by one using the quasi-peak method and reported.
- h. For testing above 1GHz, the emission level of the EUT in peak mode was 20dB lower than average limit (that means the emission level in peak mode also complies with the limit in average mode), then testing will be stopped and peak values of EUT will be reported, otherwise,

Page No. : 18 of 113

Date of Issue: Mar. 19, 2020

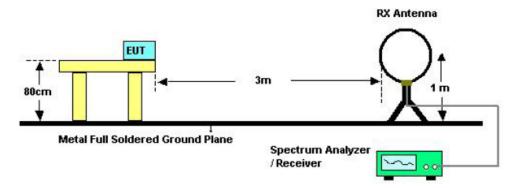

Report No.: WH-FCC-R19032702-1

the emissions will be measured in average mode again and reported.

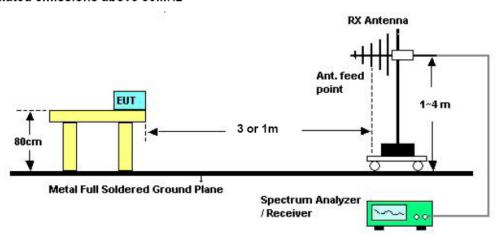

i. "Cone of radiation" has been considered to be 3dB bandwidth of the measurement antenna.

#### 7.3 Typical Test Setup

For radiated emissions below 30MHz

#### For radiated emissions above 30MHz

Above 10 GHz shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from 3m to 1m.

Distance extrapolation factor = 20 log (specific distance [3m] / test distance [1m]) (dB); Limit line = specific limits (dBuV) + distance extrapolation factor [9.54 dB].
