#### 1. General information

Applicant: PIXXGEN Corporation

Applicant address: 5F, SMART BAY, 123, Beolmal-ro, Dongan-gu, Anyang-si,

Gyeonggi-do, Republic of Korea

Test site: KES Co., Ltd.

Test site address: 3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si,

Gyeonggi-do, 14057, Korea

473-29, Gayeo-ro, Yeoju-si, Gyeonggi-do, Korea

Test Facility FCC Accreditation Designation No.: KR0100, Registration No.: 444148

FCC rule part(s): 15.247

FCC ID: 2AWVMPG11

Test device serial No.: Production Pre-production Engineering

#### 1.1. EUT description

Equipment under test RF Module

Frequency range 2 412 Mb ~ 2 462 Mb (11n\_HT20)

UNII-1 5 180 Mb ~ 5 240 Mb (11ac\_VHT20)

Model: PG11

Modulation technique WIFI: OFDM

Number of channels 2 412 MHz ~ 2 462 MHz (11n\_HT20): 11 ch

5 180 MHz ~ 5 240 MHz (11ac\_VHT20): 4ch

Antenna specification 2.4 Hz Antenna type: Dipole antenna, Peak gain: 3.67 dBi

5 @ Antenna type : : Dipole antenna, Peak gain(UNII-1) : 5.62 dBi

Power source DC 5.0 V

H/W version v1.0 S/W version v1.0

#### 1.2. Test configuration

The <u>PIXXGEN Corporation // PG11// FCC ID: 2AWVMPG11</u> was tested per the guidance of KDB 558074 D01 v05r02, ANSI C63.10-2013 was used to reference the appropriate EUT setup for radiated spurious emissions testing and AC line conducted testing.

#### 1.3. Device modifications

### 1.4. Frequency/channel operations

Ch.	Frequency (Mb)	Mode
01	2412	802.11n_HT20
:		
06	2437	802.11n_HT20
·		
11	2462	802.11n_HT20

#### 1.5. Worst case data rate

- 1. Radiated emission was performed with the EUT set to transmit at the channel with highest output power as worst-case scenario.
- 2. Worst-case data rates were: 802.11n\_HT20: MCS0

#### 1.6. Accessory information

Equipment	Manufacturer	Model	Serial No.	Power source
-	-	-	-	-

#### 1.7. Antenna information

Mada	SI	so	MIMO
Mode Antenna 0		Antenna 1	Antenna 0 + 1
802.11n(HT20)	<b>✓</b>	×	×

 $\checkmark$  = Support;  $\times$  = Not support

Antenna Model: WiFi Antenna (Dipole antenna)

Anto Gain (dBi)	Ant1 Gain (dBi)	Note
3.67	3.67	2 412 to 2 462 MHz
5.62	5.62	5 180 to 5 240 MHz

Antenna Model: Xls-857 (PCB antenna)

Ant0 Gain (dBi) Ant1 Gain (dBi)		Note
2.27	2.27	2 412 to 2 462 MHz
1.86	1.86	5 180 to 5 240 MHz

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (6) of (42)

#### 1.8. Measurement results explanation example

For all conducted test items

The offset level is set in the spectrum analyzer to compensate the RF cable loss and attenuator factor between EUT conducted output port and spectrum analyzer. With the offset compensation, the spectrum analyzer reading level is exactly the EUT RF output level.

Offset(dB) = RF cable loss(dB) + attenuator factor(dB). = 0.98 + 10 = 10.98 (dB)

#### 1.9. Measurement Uncertainty

Test Item		Uncertainty
Uncertainty for Conduction emission test		2.46 dB
Uncertainty for Radiation emission test	Below 10Hz	4.40 dB
(include Fundamental emission)	Above 10lz	5.94 dB

Note. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

2. Summary of tests

	*****	
Reference	Parameter	Test results
15.247(a)(2)	6 dB bandwidth	Pass
15.247(b)(3)	Output power	Pass
15.247(e)	Power spectral density	Pass
15.205, 15.209	Radiated restricted band and emission	Pass
15.247(d)	Conducted spurious emission and band edge	Pass
15.207(a)	AC conducted emissions	Pass

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (8) of (42)

#### 3. Test results

#### 3.1. 6 dB bandwidth

Test procedure

ANSI C63.10 - section 11.8

EUT Attenuator Spectrum analyzer

#### ANSI C63.10-2013 - Section 11.8.1

- 1. RBW = 100 kHz.
- 2.  $VBW \ge 3 \times RBW$ .
- 3. Detector = peak.
- 4. Trace mode = max hold.
- 5. Sweep = auto couple.
- 6. Allow the trace to stabilize
- 7. Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

#### ANSI C63.10-2013 - Section 11.8.2

The automatic bandwidth measurement capability of an instrument may be employed using the X dB bandwidth mode with X set to 6 dB, if the functionality described above (i.e., RBW = 100 kHz, VBW  $\geq$  3  $\times$  RBW, peak detector with maximum hold) is implemented by the instrumentation function. When using this capability, care shall be taken so that the bandwidth measurement is not influenced by any intermediate power nulls in the fundamental emission that might be  $\geq$  6 dB.

#### Limit

According to §15.247(a)(2), systems using digital modulation techniques may operate 902 ~ 928 Mbz, 2 400 ~ 2 483.5 Mbz, and 5 725 ~ 5 850 Mbz bands. The minimum 6 dB bandwidth shall be at least 500 kbz.

#### 3.2. Output power

Test procedure

ANSI C63.10 -section 11.9.1.3 and 11.9.2.3.2

#### ANSI C63.10 - section 11.9.1.3

The maximum peak conducted output power may be measured using a broadband peak RF power meter. The power meter shall have a video bandwidth that is greater than or equal to the DTS bandwidth and shall utilize a fast-responding diode detector.

#### ANSI C63.10 - section 11.9.2.3.2

Alternatively, measurements may be performed using a wideband gated RF power meter provided that the gate parameters are adjusted such that the power is measured only when the EUT is transmitting at its maximum power control level. Since this measurement is made only during the ON time of the transmitter, no duty cycle correction is required.

#### Limit

According to \$15.247(b)(3), For systems using digital modulation in the 902~928 Mz, 2 400~2 483.5 Mz, and 5 725~5 850 Mz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted out-put power. Maximum Conducted Out-put Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

According to §15.247(b)(4), The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmit-ting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

## 3.3. Power spectral density Test procedure

ANSI C63.10 - section 11.10.2

#### **ANSI C63.10 – section 11.10.2**

- 1. Set analyzer center frequency to DTS channel center frequency.
- 2. Set the span to 1.5 times the DTS channel bandwidth.
- 3. Set the RBW : 3 kHz  $\leq$  RBW  $\leq$  100 kHz
- 4. Set the VBW  $\geq$  3  $\times$  RBW.
- 5. Detector = peak.
- 6. Sweep time = auto couple.
- 7. Trace mode = max hold.
- 8. Allow trace to fully stabilize.
- 9. Use the peak marker function to determine the maximum amplitude level.
- 10. If measured value exceeds limit, reduce RBW(no less than 3 klz) and repeat.

#### Limit

According to §15.247(e), For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

#### 3.4. Radiated restricted band and emissions

#### **Test setup**

The diagram below shows the test setup that is utilized to make the measurements for emission from 9 kHz to 30 Mz Emissions.

The diagram below shows the test setup that is utilized to make the measurements for emission from 30 Mz to 1  $\mathbb{G}$ 2 emissions.

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (17) of (42)

#### Test procedure below 30 Mbz

- 1. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- 2. Then antenna is a loop antenna is fixed at one meter above the ground to determine the maximum value of the field strength. Both parallel and perpendicular of the antenna are set to make the measurement.
- 3. We have done x, y, z planes in EUT and horizontal and vertical polarization and Parallel to the ground plane in detecting antenna.
- 4. For each suspected emission, the EUT was arranged to its worst case and then the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- 5. The test-receiver system was set to average or quasi peak detect function and Specified Bandwidth with Maximum hold mode.

#### Test procedure above 30 Mbz

- 1. The EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- 2. The antenna is a bi-log antenna, a horn antenna ,and its height are varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- 3. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- **4.** The test receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- 5. Spectrum analyzer settings for f < 1  $\mathbb{H}$ :
  - ① Span = wide enough to fully capture the emission being measured
  - $\bigcirc$  RBW = 100 kHz
  - 3 VBW  $\geq$  RBW
  - 4 Detector = quasi peak

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (18) of (42)

- ⑤ Sweep time = auto
- $\bigcirc$  Trace = max hold
- 6. Spectrum analyzer settings for  $f \ge 1$  GHz: Peak
  - ① Analyzer center frequency was set to the frequency of the radiated spurious emission of interest
  - $\bigcirc$  RBW = 1 Mbz
  - ③ VBW ≥ 3 Mb
  - 4 Detector = peak
  - 5 Sweep time = auto
  - $\bigcirc$  Trace = max hold
  - 7 Trace was allowed to stabilize
- 7. Spectrum analyzer settings for  $f \ge 1$  GHz: Average
  - ① Analyzer center frequency was set to the frequency of the radiated spurious emission of interest
  - ② RBW = 1 Mbz
  - $\bigcirc$  VBW  $\geq$  3 × RBW
  - ① Detector = RMS, if span/(# of points in sweep)  $\leq$  (RBW/2). Satisfying this condition may require increasing the number of points in the sweep or reducing the span. If this condition cannot be satisfied, then the detector mode shall be set to peak.
  - ⑤ Averaging type = power(i.e., RMS)
    - 1) As an alternative, the detector and averaging type may be set for linear voltage averaging.
    - 2) Some instruments require linear display mode in order to use linear voltage averaging. Log or dB averaging shall not be used.
  - $\bigcirc$  Sweep = auto
  - $\bigcirc$  Trace = max hold
  - 8 Perform a trace average of at least 100 traces.
  - A correction factor shall be added to the measurement results prior to comparing to the emission limit in order to compute the emission level that would have been measured had the test been performed at 100 percent duty cycle. The correction factor is computed as follows:
    - 1) If power averaging (RMS) mode was used in step  $\bigcirc$ 5, then the applicable correction factor is  $10 \log(1/x)$ , where x is the duty cycle.
    - 2) If linear voltage averaging mode was used in step 5, then the applicable correction factor is  $20 \log(1/x)$ , where x is the duty cycle.
    - 3) If a specific emission is demonstrated to be continuous (≥ 98 percent duty cycle) rather than turning on and off with the transmit cycle, then no duty cycle correction is required for that emission.

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (19) of (42)

#### Note.

1. f < 30 MHz, extrapolation factor of 40 dB/decade of distance.  $F_d = 40log(D_m/Ds)$   $f \ge 30$  MHz, extrapolation factor of 20 dB/decade of distance.  $F_d = 20log(D_m/Ds)$  Where:

 $F_d$  = Distance factor in dB

 $D_m$  = Measurement distance in meters

D<sub>s</sub> = Specification distance in meters

- 3.  $CF(Correction factors(dB)) = Antenna factor(dB/m) + Cable loss(dB) + or Amp. gain(dB) + or F_d(dB)$
- 8. Field strength( $dB\mu V/m$ ) = Level( $dB\mu V$ ) + CF (dB) + or DCF(dB)
- 9. Margin(dB) = Limit(dB $\mu$ V/m) Field strength(dB $\mu$ V/m)
- 10. Emissions below 18  $\times$  were measured at a 3 meter test distance while emissions above 18  $\times$  were measured at a 1 meter test distance with the application of a distance correction factor.
- 7. The fundamental of the EUT was investigated in three orthogonal orientations X, Y and Z, it was determined that **X orientation** was worst-case orientation; therefore, all final radiated testing was performed with the EUT in **X orientation**.
- 8. The worst-case emissions are reported however emissions whose levels were not within 20 dB of respective limits were not reported.
- 9. All channels, modes (e.g. 802.11b/g/n (20 Mb BW)), and modulations/data rates were investigated among DTS band. Only the radiated emissions of the configuration that produced the worst case emissions are reported in this section.
- 10. According to exploratory test no any obvious emission were detected from 9 kHz to 30 MHz. Although these tests were performed other than open area test site, adequate comparison measurements were confirmed against 30 m open are test site. Therefore sufficient tests were made to demonstrate that the alternative site produces results that correlate with the ones of tests made in an open field based on KDB 414788.

# **Limit**According to 15.209(a), for an intentional radiator devices, the general required of field strength of radiated emissions from unintentional radiators at a distance of 3 meters shall not exceed the following values:

Frequency (Mbz)	Distance (Meters)	Radiated (μ̄V/m)
0.009 ~ 0.490	300	2400/F(kHz)
0.490 ~ 1.705	30	24000/F(kllz)
1.705 ~ 30.0	30	30
30 ~ 88	3	100**
88 ~ 216	3	150**
216 ~ 960	3	200**
Above 960	3	500

<sup>\*\*</sup>Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands  $54 \sim 72\,$  Mb,  $76 \sim 88\,$  Mb,  $174 \sim 216\,$  Mb or  $470 \sim 806\,$  Mb. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections  $15.231\,$  and  $15.241.\,$

#### **Duty cycle**

Regarding to KDB 558074 D01\_v04, 6.0, the maximum duty cycles of all modes were investigated and set the spectrum analyzer as below.

Set RBW  $\geq$  OBW if possible; otherwise, set RBW to the largest available value. Set detector = peak or average. The zero-span measurement method shall not be used unless both RBW and VBW are > 50/T and the number of sweep points across duration T exceeds 100.

Test mode	T <sub>on</sub> time (ms)	Period (ms)	Duty cycle (Linear)	Duty cycle (%)	Duty cycle correction factor (dB)
802.11n(HT20)	10	10	1	100	0

Duty cycle (Linear) =  $T_{on}$  time/Period

DCF(Duty cycle correction factor (dB)) = 10log(1/duty cycle)

#### 3.5 Conducted spurious emissions & band edge

EUT Attenuator Spectrum analyzer

#### **Test procedure**

#### Band edge

ANSI C63.10 - Section 11.11

- 1. Start and stop frequency were set such that the band edge would be placed in the center of the plot
- 2. Span was set large enough so as to capture all out of band emissions near the band edge
- 3. RBW = 100 kHz
- 4. VBW = 300 kHz
- 5. Detector = Peak
- 6. Trace mode = max hold
- 7. Sweep time = auto
- 8. The trace was allowed to stabilize

#### Out of band emissions

ANSI C63.10 - Section 11.11

- 1. Start frequency was set to 30 MHz and stop frequency was set to 25 GHz for 2.4 GHz frequencies and 40 GHz for 5 GHz frequencies
- 2. RBW = 100 kHz
- 3. VBW = 300 kHz
- 4. Detector = Peak
- 5. Trace mode = max hold
- 6. Sweep time = auto couple
- 7. The trace was allowed to stabilize

#### Limit

According to 15.247(d), in any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph(b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in section 15.209(a) is not required. In addition, radiated emission which in the restricted band, as define in section 15.205(a), must also comply the radiated emission limits specified in section 15.209(a) (see section 15.205(c))

3701, 40, Simin-daero 365beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14057, Korea Tel: +82-31-425-6200 / Fax: +82-31-424-0450 www.kes.co.kr Test report No.: KES-RF1-20T0137 Page (38) of (42)

#### Test results

#### 3.6 AC conducted emissions

#### Limit

According to 15.207(a), for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50uH/50 ohm line impedance stabilization network (LISN). Compliance with the provision of this paragraph shall on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower applies at the boundary between the frequencies ranges.

Evacuation of Emission (Mg)	Conducted limit (dBµV/m)			
Frequency of Emission (脏)	Quasi-peak	Average		
0.15 - 0.50	66 - 56*	56 - 46*		
0.50 – 5.00	56	46		
5.00 – 30.0	60	50		

#### Note:

- 1. All AC line conducted spurious emission are measured with a receiver connected to a grounded LISN while the EUT is operating at its maximum duty cycle, at maximum power, and the appropriate frequencies. All data rates and modes were investigated for conducted spurious emission. Only the conducted emissions of the configuration that produced the worst case emissions are reported in this section.
- 2. Both Cable loss and LISN factor are included in measurement level(QP Level or AV Level).
