2. General description of EUT

2.1 Basic description of EUT

Product Name: Public safety signal booster
 Product Model: Guardian B 2.0-2W
 Adding Model: /
 Trade Name: TowerIQ
 Power Supply: AC 100~240V, 50/60Hz
 Typical working voltage: AC 110V, 50/60Hz
 Power cord: AC power cord
 Frequency Band^①: 700MHz Band:
 Downlink: 758MHz ~ 775MHz, Uplink: 788MHz ~ 805MHz
 800MHz Band:
 Downlink: 851MHz ~ 861MHz, Uplink: 806MHz ~ 816MHz
 Output Power: Downlink: 2W degree: 33 ± 1 dBm; 0.5W degree: 27 ± 1 dBm
 Uplink: 27 ± 1 dBm
 System Gain: Downlink: 80dB
 Uplink: 80dB
 EUT Operating Temperature: -20°C to +50°C
 Operating Humidity: 5% to 95%
 Antenna Type: N/A^②

NOTE 1: This EUT is a broadband device, which belongs to Class B signal booster.

NOTE 2: ^①PS GuardBand : Downlink 768MHz~769MHz and Uplink 798MHz ~ 799MHz.

NOTE 3: ^② It's an indoor device, the EUT does not provide antenna by manufacturer's statement, but it requires 2W equipment that the sum of antenna gain and cable loss should not exceed 3dBi (where antenna gain is 6dBi and cable loss is at least 3dB, so the total gain is 3dBi) for Downlink and the sum of antenna gain and cable loss should not exceed 9dBi for Uplink, when the project is used by manufacturer's statement.

NOTE 4: According to the requirements of the manufacturer, 2W and 0.5W grade equipment can be provided. Except for the different output power of Downlink, all other technical parameters and components are the same. At the same time, the output power of the equipment can be adjusted from 0.5W to 2W through debugging software. the basic test will be conducted with the maximum output power of 2W, and the output power test data of 0.5W Downlink will be supplemented.

2.3 Signal Booster control process

2.3.1 System block

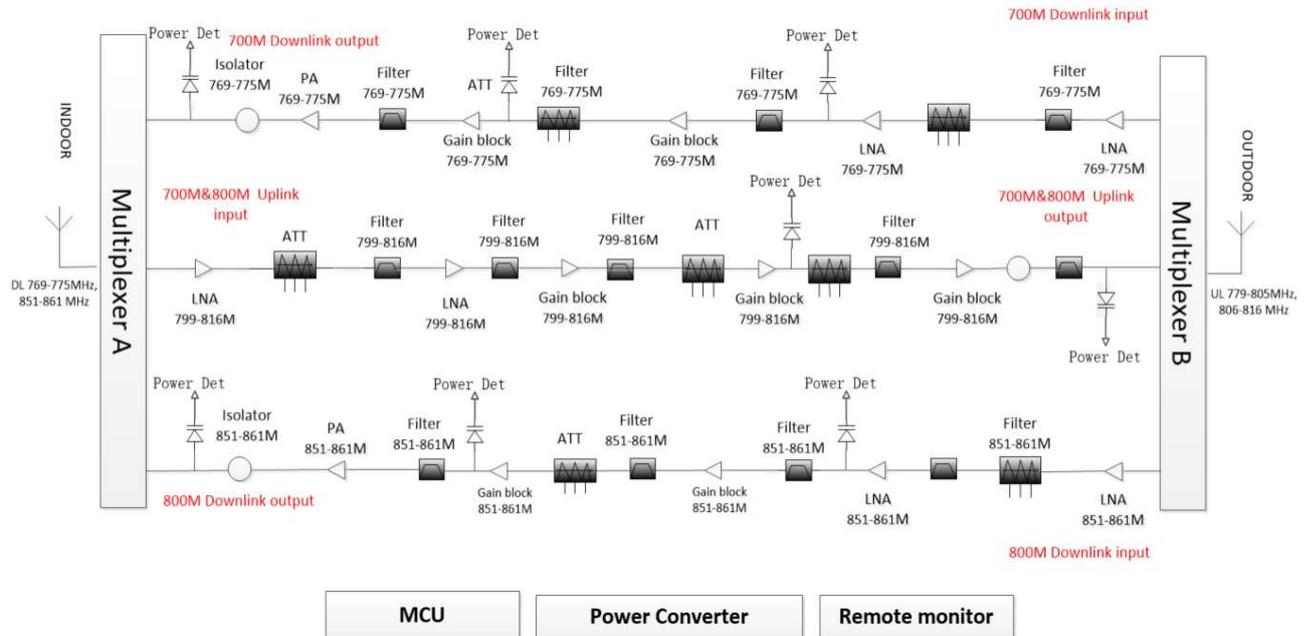

Figure 2-1 System block diagram

The block diagram is composed of the following units:

- Uplink input Power detector;
- Uplink output Power detector;
- Uplink PA switch integrated in PA;
- Downlink input Power detector;
- Downlink PA switch integrated in PA, and so on

2.3.2 Signal control process

Above is the system block diagram, this system can enhance mobile communication signal. In the downlink, the BTS signals are received by donor antenna of the repeater. After the duplexer, the signals are sent to the LNA module for pre-amplification and digital RF integrated module for digital filtering and frequency conversion.

Then the DL signals will be sent to downlink PA to amplify power and filter via duplexer. After amplification, the signals are transmitted via the MT port to the service antenna.

In the uplink, the mobile signals are received by the service antenna. After the MT port integrated duplexer, the signals are sent to the LNA, integrated module for digital filtering, then to PA for power amplification and to duplexer.

After that, the uplink signals are sent to the donor antenna for transmission back to the BTS.

5. About Signal Booster

According to the basic information of EUT, FCC part 90.219 (a) and KDB 935210 D02 APPENDIX A3.1 rules, this EUT belongs to PART 90 class B Industrial signal booster and it is a non SMR

5.1 KDB 935210 D02 APPENDIX A3.1

A.3.1 Signal Booster (Section 90.219)

A **Signal Booster (Section 90.219)** is a device or system that automatically receives, amplifies, and retransmits signals from wireless stations into and out of building interiors, tunnels, shielded outdoor areas and other locations where these signals would otherwise be too weak for reliable communications. Signal booster systems may contain both Class A and Class B signal boosters as components. [Section 90.219(a)]

All **Section 90.219 boosters** are a type of Industrial Signal Booster, and are classified as either **Class A boosters** (narrowband) or **Class B boosters** (wideband). [R11] [Order, ¶ 15]

Note also that Consumer Signal Boosters are not defined for PLMRS or PSRS because licensees are considered to operate private services. Part 90 PLMR licensees typically obtain authorizations for individual narrowband channels or groups of channels to satisfy their own communication needs. Moreover, many Part 90 channels are interleaved and a licensee's channels may not be adjacent to one another, which presents unique considerations for signal boosters used with Part 90 PLMR services. [Order, ¶ 144]

a) Class A signal booster: A signal booster designed to retransmit signals on one or more specific channels. A signal booster is deemed to be a Class A signal booster if none of its passbands exceed 75 kHz. [Section 90.219(a)]

b) Class B signal booster: A signal booster designed to retransmit any signals within a wide frequency band. A signal booster is deemed to be a Class B signal booster if it has a passband that exceeds 75 kHz. [Section 90.219(a)]

Class B signal boosters may be deployed only at fixed locations; mobile operation of Class B signal boosters is prohibited (after November 1, 2014). [Section 90.219(d)(4)]

Except for signal boosters incorporating distributed antenna systems (DAS) and installed in buildings, the passband of a Class B booster shall not encompass both commercial services (such as ESMR and Cellular Radiotelephone) and Part 90 Land Mobile and Public Safety Services. [Section 90.219(d)(7)]

5.2 FCC part 90.219 (a) Definitions

§90.219 Use of signal boosters.

This section contains technical and operational rules allowing the use of signal boosters in the Private Land Mobile Radio Services (PLMRS). Rules for signal booster operation in the Commercial Mobile Radio Services under part 90 are found in §20.21 of this chapter.

Electronic Code of Federal Regulations (eCFR)

(a) *Definitions.* The definitions in this paragraph apply only to the rules in this section.

Class A signal booster. A signal booster designed to retransmit signals on one or more specific channels. A signal booster is deemed to be a Class A signal booster if none of its passbands exceed 75 kHz.

Class B signal booster. A signal booster designed to retransmit any signals within a wide frequency band. A signal booster is deemed to be a Class B signal booster if it has a passband that exceeds 75 kHz.

6. Test modes

Test modes	TX mode: “OUTSIDE” port of the EUT is connected to the signal generator, “INSIDE” port is connected to the spectrum analyzer through attenuator, and the power of the EUT is turned on and signal is sent. RX mode: “INSIDE” port of the EUT is connected to the signal generator, “OUTSIDE” port is connected to the spectrum analyzer through attenuator, and the power of the EUT is turned on and signal is sent.

8. Measurements uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

Measurement		Frequency	Uncertainty
Radiated Emission	Horizontal	30MHz~1000MHz	4.8dB
	Horizontal	1GHz~18GHz	5.1dB
	Vertical	30MHz~1000MHz	4.9dB
	Vertical	1GHz~18GHz	5.0dB

Measurement	Uncertainty
RF frequency	6.0×10^{-6}
RF power conducted	0.60dB
Occupied channel bandwidth	0.40%
Unwanted emission, conducted	0.66dB
Humidity	6.0%
Temperature	2.0°C

Note: This uncertainty represents an expanded uncertainty factor of $k=2$.

10. Radio technical requirement specification

10.1 Test Frequencies

Test requirement: KDB 935210 D02 APPENDIX D/Table D.3
 FCC PART 2.1057
 ANSI C63.26-2015 Clause 5.1.2

10.1.1 Requirements

According to FCC regulations, FCC part 2.1057, ANSI c63.26-2015 clause 5.1.2 and KDB 935210 D02 Appendix D / table D.3 have relevant frequency band requirements.

10.1.1.1 FCC PART 2.1057

§2.1057 Frequency spectrum to be investigated.

(a) In all of the measurements set forth in §§2.1051 and 2.1053, the spectrum shall be investigated from the lowest radio frequency signal generated in the equipment, without going below 9 kHz, up to at least the frequency shown below:

(1) If the equipment operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

(2) If the equipment operates at or above 10 GHz and below 30 GHz: to the fifth harmonic of the highest fundamental frequency or to 100 GHz, whichever is lower.

(3) If the equipment operates at or above 30 GHz: to the fifth harmonic of the highest fundamental frequency or to 200 GHz, whichever is lower.

(b) Particular attention should be paid to harmonics and subharmonics of the carrier frequency as well as to those frequencies removed from the carrier by multiples of the oscillator frequency. Radiation at the frequencies of multiplier stages should also be checked.

(c) The amplitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be reported.

(d) Unless otherwise specified, measurements above 40 GHz shall be performed using a minimum resolution bandwidth of 1 MHz.

10.1.1.2 ANSI C63.26-2015 Clause 5.1.2

5.1.2 Number of fundamental frequencies to be tested in EUT transmit band

5.1.2.1 General requirement

Measurements of transmitters shall be performed and, if required, reported for each frequency band in which the EUT can be operated with the device transmitting at the number of frequencies in each band specified in Table 2.

²⁴ See 47 CFR 2.1057.

Table 2—Number of frequencies to be tested

Frequency range over which EUT operates	Number of frequencies	Location in frequency range of operation
1 MHz or less	1	Middle
1 MHz to 10 MHz	2	1 near top and 1 near bottom
More than 10 MHz	3	1 near top, 1 near middle, and 1 near bottom

The EUT will utilize bands:

700MHz Band: Downlink: 758MHz ~ 775MHz, Uplink: 788MHz ~805MHz
800MHz Band: Downlink: 851MHz ~861MHz, Uplink: 806MHz ~ 816MHz

10.1.2 Result

This project is only reported and checked, the frequency range of this EUT meets the above regulatory requirements.

10.2 Input Signals

Test requirement: KDB 935210 D05 clause 4.1

10.2.1 Requirements

KDB 935210 D05 clause 4.1

The procedures in this clause are specific to EUTs intended for operating in the Private Land Mobile Radio Services (PLMRS) and Public Safety Radio Services (PSRS)⁵, which are governed under the provisions and requirements of the Part 90 rules (i.e., Section 90.219 applies).

Table 1 depicts signal types associated with PLMRS operations, which are to be considered as test signals to be used in performing compliance testing on PLMRS amplifiers, repeaters, and industrial boosters. Not all of the procedures in this clause will require using each of the signals listed in Table 1, because for

⁵ As explained in § 90.16, Public Safety Radio Services is part of the Public Safety Radio Pool, also known as the Public Safety Pool.

many EUTs a CW tone can adequately model the narrowband signals typically encountered within these services. For EUTs supporting digitally modulated signals, the intended operating signal types should be tested (e.g., P25 Phase 1, P25 Phase 2, TETRA, etc.), especially for PSRS devices. Devices intended for use in 700 MHz Public Safety Broadband spectrum shall be tested using a representative band-limited AWGN signal (99 % OBW of 4.1 MHz) or the applicable signal type (e.g., LTE).
