TEST DATE: 1st March - 11th March 2021

TESTED BY: Steven Hodgkinson  
Element

**2.1 Test Summary (Section 1 DTS Mode).**

<b>Test Method and Description</b>		<b>Requirement Clause 47CFR15</b>	<b>Requirement Clause RSS</b>	<b>Applicable to this equipment</b>	<b>Result / Note</b>
Radiated spurious emissions (restricted bands of operation and cabinet radiation)		15.247 (d)	247, 3.3	<input checked="" type="checkbox"/>	Pass
AC power line conducted emissions		15.207	Gen, 8.8	<input type="checkbox"/>	Note 1
Occupied bandwidth		15.247 (a) (2)	247, 5.2 (a)	<input checked="" type="checkbox"/>	Pass
Conducted carrier power	Peak	15.247 (b) (3)	247, 5.4 (d)	<input checked="" type="checkbox"/>	Pass
	Max.			<input type="checkbox"/>	
Out of band emissions		15.247 (d)	247, 5.5	<input checked="" type="checkbox"/>	Pass
Power spectral density		15.247 (e)	247, 5.2 (b)	<input checked="" type="checkbox"/>	Pass
Calculation of duty correction		-	15.35 (c)	<input type="checkbox"/>	Note 2

**Specific Note:**

1. The EUT is a battery powered device
2. The EUT was transmitting 100% in test modes provided by the client.
3. The equipment under test operates in the following modes LoRa, and LoRaWan
4. The equipment under test, as declared by the client is a hybrid device.  
KDB 558074 D01 15.247 Meas guidance v05r02, section 10 Hybrid System Equipment Under Section 15.247 was used for guidance, to cover the additional requirements for FHSS operation.
5. Section 1 of this test report covers the DTS requirement, as the equipment uses 500 kHz Bandwidth, section 2 of this test report covers the frequency hopping requirements (125 kHz bandwidth).

## 2.2 Test Summary (Section 2 FHSS Mode).

<b>Test Method and Description</b>	<b>Requirement Clause 47CFR15</b>	<b>Requirement Clause RSS</b>	<b>Applicable to this equipment</b>	<b>Result / Note</b>
Radiated spurious emissions (restricted bands of operation and cabinet radiation)	15.247(d)	247, 3.3	<input checked="" type="checkbox"/>	Pass
AC power line conducted emissions	15.207	Gen, 8.8	<input type="checkbox"/>	Note 1
Carrier frequency separation	15.247 (a) (1)	247, 5.1 (b)	<input checked="" type="checkbox"/>	Pass
Number of hopping channels	15.247 (a) (1) (i), (ii) and (iii)	247, 5.1 (c), (d) and (e)	<input checked="" type="checkbox"/>	Pass Note 2
Average time of occupancy	15.247 (a) (1) (i), (ii) and (iii)	247, 5.1 (c), (d) and (e)	<input checked="" type="checkbox"/>	Pass
Maximum peak conducted output power	15.247 (a) (1), (b)(1) and (b)(2)	247, 5.4 (a), (b) and (c)	<input checked="" type="checkbox"/>	Pass
20 dB emission bandwidth	15.247 (a) (1) (i) and (ii)	247, 5.1 (a)	<input checked="" type="checkbox"/>	Pass
Out-of-band emissions	15.247(d)	247, 5.5	<input checked="" type="checkbox"/>	Pass
Power spectral density	15.247 (e)	247, 5.2 (b)	<input checked="" type="checkbox"/>	Pass

1. The EUT is a battery powered device
2. The Equipment was tested as a Hybrid System using KDB 558074 D01 15.247 Measurement guidance v05r02 Section 10.

### **Navitas Pod basic operating mode for FHSS (125 kHz bandwidth).**

The equipment enters an acquisition mode and starts frequency hopping across 64 channels, until communication is established with the LoRaWan network.

The LoRaWan network assigns one of the 8 frequency blocks. Each frequency block contains 8 frequency hopping channels.

Once communication is established between the network hub, and the EUT, the EUT starts to frequency hop across 8 channels within one of the 8 frequency blocks.

### **2.3 HYBRID SYSTEM EQUIPMENT KDB 558074 D01 15.247 v05r02 Section 10**

b) Hybrid system device measurement guidelines are as follows.

- 1) As specified in section 15.247 (f), a hybrid system must comply with power density standard of 8 dBm in any 3 kHz band, when the frequency hopping function is switched off.
- 2) The transmission must comply with a 0.4 second/channel maximum dwell time when hopping function is turned on.
- 3) There is no requirement for this type of hybrid system to comply with the 500 kHz minimum Bandwidth normally associated with a DTS device.
- 4) There is no minimum number of hopping channels associated with this type of hybrid system While there is not a specific minimum limit, the hop sequence is required to appear as pseudorandom per section 15.247(a)(1).
- 5) The Hopping function must be a true frequency hopping system as described in section 15.247(a)(1). The specific requirements in section 15.247(a)(1) are:
  - i) a minimum channel separation;
  - ii) pseudo-random hop sequence;
  - iii) equal use of each frequency;

#### **General Notes:**

The results contained in this report relate only to the items tested, in the condition at time of test, and were obtained in the period between the date of initial receipt of samples and the date of issue of the report.

The apparatus was set up and exercised using the configurations, modes of operation and arrangements defined in this report only. Any modifications made are identified in Section 8 of this report.

Particular operating modes, apparatus monitoring methods and performance criteria required by the standards tested to have been performed except where identified in Section 5.2 of this test report (Deviations from Test Standards)

## 4 Introduction

This report TRA-053699-47-00A presents the results of the Radio testing on a SmartSentry Ltd, Smart Pod 3 to specification 47CFR15 Radio Frequency Devices. RSS-247 - Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices.

The testing was carried out for SmartSentry Ltd by Element, at the address detailed below.

- |                          |   |                                     |   |

|--------------------------|---|-------------------------------------|---|

This report details the configuration of the equipment, the test methods used and any relevant modifications where appropriate.

All test and measurement equipment under the control of the laboratory and requiring calibration is subject to an established programme and procedures to control and maintain measurement standards. The quality management system meets the principles of ISO 9001, and has quality control procedures for monitoring the validity of tests undertaken. Records and sufficient detail are retained to establish an audit trail of calibration records relating to its test results for a defined period. Under control of the established calibration programme, key quantities or values of the test & measurement instrumentation are within specification and comply with the relevant traceable internationally recognised and appropriate standard specifications, which are UKAS calibrated as such where these properties have a significant effect on results. Participation in inter-laboratory comparisons and proficiency testing ensures satisfactory correlation of results conform to Elements own procedures, as well as statistical techniques for analysis of test data providing the appropriate confidence in measurements.

Throughout this report EUT denotes equipment under test.

### FCC Site Listing:

Element is accredited for the above sites under the US-EU MRA, Designation number UK0009.

### IC Registration Numbers:

Element Hull	3483A
Element North West	3930B

The test site requirements of ANSI C63.4-2014 are met up to 1GHz.

The test site SVSWR requirements of CISPR 16-1-4:2010 are met over the frequency range 1 GHz to 18 GHz.

## **5 Test Specifications**

### **5.1 Normative References**

- FCC 47 CFR Ch. I – Part 15 – Radio Frequency Devices.
- ISED RSS-247, Issue 2, February 2017 – Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices.
- ISED RSS-Gen, Issue 5, March 2019 – General Requirements for Compliance of Radio Apparatus.
- ANSI C63.10-2013 – American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.
- ANSI C63.4-2014 – American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.
- KDB 558074 D01 15.247 Measurement guidance v05r02

### **5.2 Deviations from Test Standards**

There were no deviations from the test standard.

## 7 Equipment under Test

### 7.1 EUT Identification

- Name: Smart Pod 3
- Serial Number: 1-2
- Model Number: Smart Pod 3
- Software Revision:1
- Build Level / Revision Number: 1

### 7.2 System Equipment

Equipment listed below forms part of the overall test setup and is required for equipment functionality and/or monitoring during testing. The compliance levels achieved in this report relate only to the EUT and not items given in the following list.

Test Laptop: Lenovo Thinkpad

### 7.3 EUT Mode of Operation

The Equipment under test, was programmed via the client provided test software. The software provided selections of operating frequencies, and the operating bandwidths, 500 kHz for DTS operation, and 125 kHz for FHSS operation.

### 7.4 EUT Radio Parameters

#### 7.4.1 General (DTS mode)

<b>Frequency of operation:</b>	902 MHz-928 MHz Band
<b>Modulation type(s):</b>	LoRa Chirp Spread Spectrum
<b>Occupied channel bandwidth(s):</b>	500 kHz
<b>Declared output power(s):</b>	14 dBm
<b>Warning against use of alternative antennas in user manual (yes/no):</b>	Not Applicable, internal chip antenna
<b>Nominal Supply Voltage:</b>	3.6 Vdc

#### 7.4.1 General (FHSS mode)

<b>Frequency of operation:</b>	902 MHz-928 MHz Band
<b>Modulation type(s):</b>	LoRa Chirp Spread Spectrum
<b>Occupied channel bandwidth(s):</b>	125 kHz
<b>Declared output power(s):</b>	14 dBm
<b>Warning against use of alternative antennas in user manual (yes/no):</b>	Not Applicable, internal chip antenna
<b>Nominal Supply Voltage:</b>	3.6 Vdc

#### 7.4.2 Antennas

<b>Type:</b>	AVX M620720
<b>Frequency range:</b>	902 MHz-928 MHz
<b>Impedance:</b>	50 $\Omega$
<b>SWR:</b>	2.5:1 Max
<b>Gain:</b>	0.75 dBi
<b>Polarisation:</b>	Linear

#### 7.5 EUT Description

The Navitas Pod measures ambient air temperature and light level, as well as optionally the temperature inside an object using a flying temperature lead. The device operates in the 902MHz to 928MHz ISM frequency band, it utilises LoRaWan.

## **8 Modifications**

No modifications were performed during this assessment.

## 9 EUT Test Setup

### 9.1 Block Diagram

The following diagram shows basic EUT interconnections with cable type and cable lengths identified:

## 9.2 General Set-up Photograph

The following photograph shows basic EUT set-up:

### **9.3 Measurement software**

Where applicable, the following software was used to perform measurements contained within this report.

Element Emissions R5  
Element Transmitter Bench Test

## 10 General Technical Parameters

### 10.1 Normal Conditions

The EUT was tested under the normal environmental conditions of the test laboratory, except where otherwise stated. The normal power source applied was 3.6 Vdc from Lithium batteries

### 10.2 Varying Test Conditions

There are no specific frequency stability requirements for the type of device. The results contained in this report demonstrate that the occupied bandwidth is contained within the authorised band and the manufacturer has declared sufficient frequency stability (refer to section 7.4).

Variation of supply voltage is required to ensure stability of the declared output power. During carrier power testing the following variations were made:

	<b>Category</b>	<b>Nominal</b>	<b>Variation</b>
<input type="checkbox"/>	Mains	110 Vac +/-2 %	85 % and 115 %
<input checked="" type="checkbox"/>	Battery	New battery	N/A

## 11 Results Section 1 DTS mode of Operation

### 12 Maximum peak conducted output power

#### 12.1 Definition

The maximum peak conducted output power is defined as the maximum power level measured with a peak detector using a filter with width and shape of which is sufficient to accept the signal bandwidth.

The maximum conducted output power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level.

#### 12.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 11.9.1
Frequencies Measured:	903.0 MHz / 915.0 MHz / 927.5 MHz
EUT Channel Bandwidths:	500 kHz
Deviations From Standard:	None
Measurement BW:	1 MHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	3 MHz
Measurement Detector:	Peak
Voltage Extreme Environment Test Range:	Mains Power = 85 % and 115 % of Nominal (FCC only requirement); Battery Power = new battery.

#### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 35 % RH	20 % RH to 75 % RH (as declared)

#### 12.3 Test Limit

For systems employing digital modulation techniques operating in the bands 902 to 928 MHz, 2400 to 2483.5 MHz and 5725 to 5850 MHz, the maximum peak conducted output power shall not exceed 1 W.

## 12.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iv, the resolution bandwidth of the spectrum analyser was increased above the EUT occupied bandwidth and the peak emission data noted.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

**Figure iv Test Setup**

## 12.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18
Attenuator	AtlanTechRF Microwave	10dB SMA	U634	Cal in use
SMBV100A	R&S	Signal Generator	U674	2021-05-12

## 12.6 Test Results

LoRa 500 kHz channel					
Channel Frequency (MHz)	Max Power (dBm)	Antenna Gain (dBi)	EIRP (dBm)	EIRP (mW)	Result
903.0	13.75	0.75	14.50	0.028	PASS
915.0	13.89	0.75	14.64	0.029	PASS
927.5	13.94	0.75	14.69	0.029	PASS

903.0 MHz

Date: 3.MAR.2021 11:56:06

915.0 MHz

Date: 3.MAR.2021 11:57:18

927.5 MHz

Date: 3.MAR.2021 12:12:10

## 13 Power spectral density

### 13.1 Definition

The power per unit bandwidth.

### 13.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 11.10
Frequencies Measured:	903.0 MHz / 915.0 MHz/ 927.5 MHz
EUT Channel Bandwidths:	500 kHz
Deviations From Standard:	None
Measurement BW:	3 kHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	10 kHz
Measurement Span: (requirement 1.5 times Channel BW)	1 MHz
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 35 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6Vdc	

### 13.3 Test Limit

The transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

### 13.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vi, the peak emission of the EUT was measured on a spectrum analyser, with path losses taken into account.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

Figure vi Test Setup

### 13.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18
Attenuator	AtlanTechRF Microwave	10dB SMA	U634	Cal in use
SMBV100A	R&S	Signal Generator	U674	2021-05-12

### 13.6 Test Results

LoRa 500 kHz channel			
Channel Frequency (MHz)	Max PSD (dBm)	Limit (dBm)	Result
903.0	-1.85	8.0	PASS
915.0	-1.31	8.0	PASS
927.5	-1.19	8.0	PASS

903.0 MHz

Date: 3.MAR.2021 12:05:46

915.0 MHz

Date: 3.MAR.2021 12:07:30

927.5 MHz

Date: 3.MAR.2021 12:08:34

## 14 Occupied Bandwidth

### 14.1 Definition

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal.

### 14.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	IC: ANSI C63.10-2013, Clause 6.9 FCC: ANSI C63.10-2013, Clause 11.8
Frequencies Measured:	903.0 MHz / 915.0 MHz / 927.5 MHz
EUT Channel Bandwidths:	500 kHz
EUT Test Modulations:	LoRa
Deviations From Standard:	None
Measurement BW:	100 kHz
(IC requirement: 1% to 5% OBW;	10 kHz
FCC requirement: 100 kHz)	
Spectrum Analyzer Video BW:	300 kHz
(requirement at least 3x RBW)	50 kHz
Measurement Span:	2 MHz
(requirement 2 to 5 times OBW)	
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 35 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 14.3 Test Limit

The minimum -6 dB bandwidth shall be at least 500 kHz.

#### 14.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iii, the bandwidth of the EUT was measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

Figure iii Test Setup

#### 14.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration

## 15 Out-of-band and conducted spurious emissions

### 15.1 Definition

#### *Out-of-band emission.*

Emission on a frequency or frequencies immediately outside the necessary bandwidth that results from the modulation process but excluding spurious emissions.

#### *Spurious emission.*

Emission on a frequency or frequencies that are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products, and frequency conversion products, but exclude out-of-band emissions.

### 15.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 11.11
Frequencies Measured:	903.0 MHz / 915.0 MHz/ 927.5 MHz
EUT Channel Bandwidths:	500 kHz
Deviations From Standard:	None
Measurement BW:	100 kHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	300 kHz
Measurement Detector:	Peak
Measurement Range:	9 kHz to 10 GHz

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 35 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 15.3 Test Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in FCC 47CFR15.209(a) / RSS-Gen is not required.

### 15.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure v, the emissions from the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

## Upper Conducted Band edge

Date: 3.MAR.2021 14:49:47

## 16 Radiated emissions

### 16.1 Definitions

#### *Spurious emissions*

Emissions on a frequency or frequencies, which are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products and frequency conversion products, but exclude out-of-band emissions.

#### *Restricted bands*

A frequency band in which intentional radiators are permitted to radiate only spurious emissions but not fundamental signals.

### 16.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Chamber 1
Test Standard and Clause:	ANSI C63.10-2013, Clause 6.5 and 6.6
EUT Frequencies Measured:	903.0 MHz/915.0 MHz/927.5 MHz
Deviations from Standard:	None
Measurement BW:	30 MHz to 1 GHz: 120 kHz; Above 1 GHz: 1 MHz
Measurement Detector:	Up to 1 GHz: quasi-peak; Above 1 GHz: RMS average and Peak

### Environmental Conditions (Normal Environment)

Temperature: 20 °C	+15 °C to +35 °C (as declared)
Humidity: 37 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 16.3 Test Limit

Unwanted emissions that fall within the restricted frequency bands shall comply with the limits specified:

#### General Field Strength Limits for License-Exempt Transmitters at Frequencies above 30 MHz

<i>Frequency (MHz)</i>	<i>Field Strength (<math>\mu\text{V}/\text{m}</math> at 3 m)</i>	<i>Field Strength (dB<math>\mu\text{V}/\text{m}</math> at 3 m)</i>
30 to 88	100	40.0
88 to 216	150	43.5
216 to 960	200	46.0
Above 960	500	54.0

On frequencies below or equal to 1000 MHz, the limits shown are based on measuring equipment employing a CISPR quasi-peak detector function. On frequencies above 1000 MHz, the radiated emission limits are based on the use of measurement instrumentation employing an average detector function. The limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit.

## 16.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure i, the emissions from the EUT were measured on a spectrum analyzer / EMI receiver.

Radiated electromagnetic emissions from the EUT are checked first by preview scans. Preview scans for all spectrum and modulation characteristics are checked, using a peak detector and where applicable worst-case determined for function, operation, orientation, etc. for both vertical and horizontal polarisations. Pre-scan plots are shown with a peak detector and 100 kHz RBW.

If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.10 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed, (see EUT setup photographs for more detail).

Emissions between 30 MHz and 1 GHz are measured using calibrated broadband antennas. Emissions above 1 GHz are characterized using standard gain horn antennas. Pre-amplifiers and filters are used where required. Care is taken to ensure that test receiver resolution bandwidth, video bandwidth and detector type(s) meet the regulatory requirements.

For both horizontal and vertical polarizations, the EUT is then rotated through 360 degrees in azimuth until the highest emission is detected. At the previously determined azimuth the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected, this maximum value is recorded.

Power values measured on the test receiver / analyzer are converted to field strength, FS, in dBµV/m at the regulatory distance, using:

$$FS = PR + CL + AF - PA + DC - CF$$

$$\text{Factor} = AF + CL - PA$$

Where,

PR is the power recorded on the receiver / spectrum analyzer in dBµV;

CL is the cable loss in dB;

AF is the test antenna factor in dB/m;

PA is the pre-amplifier gain in dB (where used);

DC is the duty correction factor in dB (where used, e.g. harmonics of pulsed fundamental);

CF is the distance factor in dB (where measurement distance different to limit distance);

This field strength value is then compared with the regulatory limit.

**Figure i Test Setup**

## 17 Results Section 2 FHSS mode of Operation

### 18 Maximum peak conducted output power

#### 18.1 Definition

The maximum peak conducted output power is defined as the maximum power level measured with a peak detector using a filter with width and shape of which is sufficient to accept the signal bandwidth.

#### 18.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 7.8.5
Frequencies Measured:	902.3 MHz/ 914.9 MHz/ 927.5 MHz – hopping disabled.
EUT Channel Bandwidths:	125 kHz
Deviations From Standard:	None
Measurement BW:	200 kHz
Spectrum Analyzer Video BW:	500 kHz
Measurement Detector:	Peak
Voltage Extreme Environment Test Range:	Battery Power = new battery.

#### Environmental Conditions (Normal Environment)

Temperature: 20 °C	+15 °C to +35 °C (as declared)
Humidity: 37 % RH	20 % RH to 75 % RH (as declared)

#### 18.3 Test Limit

- For frequency hopping systems operating in the band 902 to 928 MHz, the maximum peak conducted output power shall not exceed 1 W, and the e.i.r.p. shall not exceed 4 W, if the hopset uses 50 or more hopping channels; the maximum peak conducted output power shall not exceed 0.25 W, and the e.i.r.p. shall not exceed 1 W, if the hopset uses less than 50 hopping channels.
- For frequency hopping systems operating in the band 2400 to 2483.5 MHz and employing at least 75 hopping channels, the maximum peak conducted output power shall not exceed 1 W; for all other frequency hopping systems in the band, the maximum peak conducted output power shall not exceed 0.125 W. The e.i.r.p. shall not exceed 4 W.
- For frequency hopping systems operating in the band 5725 to 5850 MHz, the maximum peak conducted output power shall not exceed 1 W. The e.i.r.p. shall not exceed 4 W.
- Point-to-point systems in the bands 2400-2483.5 MHz and 5725 to 5850 MHz are permitted to have an e.i.r.p. higher than 4 W provided that the higher e.i.r.p. is achieved by employing higher gain directional antennas and not higher transmitter output powers.

### 18.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vi, the resolution bandwidth of the spectrum analyser was increased above the EUT occupied bandwidth and the peak emission data noted.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

927.5 MHz

Date: 5.MAR.2021 11:55:05

## 19 Power spectral density

### 19.1 Definition

The power per unit bandwidth.

### 19.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 11.10
Frequencies Measured:	902.3 MHz / 914.9 MHz/ 927.5 MHz
EUT Channel Bandwidths:	125 kHz
Deviations From Standard:	None
Measurement BW:	3 kHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	10 kHz
Measurement Span: (requirement 1.5 times Channel BW)	
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 35 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6Vdc	

### 19.3 Test Limit

The transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

Note: Section 10 of KDB 558074 D01 v05r02 Hybrid system equipment under section 15.247.

As specified in section 15.247(f), a hybrid system must comply with the power density standard of 8 dBm in any 3 kHz band when the frequency hopping function is turned off.

#### 19.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vi, the peak emission of the EUT was measured on a spectrum analyser, with path losses taken into account.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

Figure vi Test Setup

#### 19.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18
Attenuator	AtlanTechRF Microwave	10dB SMA	U634	Cal in use
SMBV100A	R&S	Signal Generator	U674	2021-05-12

## 19.6 Test Results

LoRaWan 125 kHz channel			
Channel Frequency (MHz)	Max PSD (dBm)	Limit (dBm)	Result
902.3	7.37	8.0	PASS
914.9	7.56	8.0	PASS
927.5	7.38	8.0	PASS

902.3 MHz

Date: 5.MAR.2021 12:00:08

927.5 MHz

Date: 5.MAR.2021 12:02:10

## 20 Number of hopping frequencies

### 20.1 Definition

The total number of hopping frequencies (the centre frequencies defined within the hopping sequence of a FHSS equipment) which are randomly sequenced in order to spread the transmission.

### 20.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 7.8.3
Frequencies Measured:	902.0 MHz – 928 MHz
EUT 20dB Bandwidth:	144 kHz
EUT Test Modulations:	Internal pattern generation – hopping enabled
Deviations From Standard:	None
Measurement BW:	20 kHz
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 32 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 20.3 Test Limit

- For frequency hopping systems in the band 902 to 928 MHz: if the -20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping channels; If the -20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping channels;
- Frequency hopping systems operating in the band 2400 to 2483.5 MHz shall use at least 15 hopping channels;
- Frequency hopping systems operating in the band 5725 to 5850 MHz shall use at least 75 hopping channels.

Note: The equipment under test does not meet the above frequency hopping requirements KDB 558074 D01 15.247 Measurement Guidance v05r02 was used for guidance

Section 10 of KDB 558074 D01 Hybrid system equipment under section 15.247

The transmission must comply with a 0.4 second/channel maximum dwell time, when the hopping function is turned on.

There are no minimum number of hopping channels associated with this type of hybrid system While no there is not a specific minimum limit, the hop sequence is required to appear as pseudorandom as per Section 15.247 (a)(1).

## 20.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iv, the emissions of the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each nominal bandwidth.

**Figure iv Test Setup**

## 20.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18
Attenuator	AtlanTechRF Microwave	10dB SMA	U634	Cal in use
SMBV100A	R&S	Signal Generator	U674	2021-05-12

## 20.6 Test Results

### LoRaWan 125 kHz channel

Number of hopping channels observed during acquisition mode.  
64 Hopping channels observed

Date: 9.MAR.2021 10:12:10

**LoRaWan 125 kHz channel**

Number of hopping channels observed after the network assigned a frequency block.  
8 hopping channels observed.

Date: 9.MAR.2021 10:55:45

## 21 Average channel occupancy

### 21.1 Definition

The channel occupancy is the total of the transmitter 'on' times, during an observation period, on a particular hopping frequency.

### 21.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 7.8.4
Frequencies Measured:	Mid
EUT 20dB bandwidth:	144 kHz
EUT Number of hopping channels:	64 or 8
EUT Test Modulations:	Internal pattern generation – hopping enabled
Deviations From Standard:	None
Measurement BW:	100 kHz
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 20 °C	+15 °C to +35 °C (as declared)
Humidity: 32 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 21.3 Test Limit

- For frequency hopping systems in the band 902 to 928 MHz: if the -20 dB bandwidth of the hopping channel is less than 250 kHz, the average time of occupancy on any channel shall not be greater than 0.4 seconds within a 20 second period;  
If the -20 dB bandwidth of the hopping channel is 250 kHz or greater, the average time of occupancy on any channel shall not be greater than 0.4 seconds within a 10 second period;
- Frequency hopping systems operating in the band 2400 to 2483.5 MHz: The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds, multiplied by the number of hopping channels employed;
- Frequency hopping systems operating in the band 5725 to 5850 MHz: The average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 30 second period.

Note: The equipment under test does not meet the above frequency hopping requirements  
KDB 558074 D01 15.247 Measurement Guidance v05r02 was used for guidance

Section 10 of KDB 558074 D01 Hybrid system equipment under section 15.247

The transmission must comply with a 0.4 second/channel maximum dwell time, when the hopping function is turned on.

There are no minimum number of hopping channels associated with this type of hybrid system  
While no there is not a specific minimum limit, the hop sequence is required to appear as pseudorandom as per Section 15.247 (a)(1).

### 21.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure v, the emissions of the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. A number of hops were observed to confirm consistency of the dwell time / observe the worst case. All modulation schemes, data rates and power settings were used to observe the worst-case configuration.

**Figure v Test Setup**

### 21.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18
Attenuator	AtlanTechRF Microwave	10dB SMA	U634	Cal in use
SMBV100A	R&S	Signal Generator	U674	2021-05-12

Number of transmissions during 20 second observation period  
8 hopping channels

Date: 9.MAR.2021 12:06:55

## 22 Carrier frequency separation

### 22.1 Definition

The carrier frequency separation is the frequency separation between two adjacent hopping frequencies.

### 22.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 7.8.2
Frequencies Measured:	902 MHz-928 MHz
EUT 20dB Bandwidth:	144 kHz
EUT Test Modulations:	Internal pattern generation – hopping enabled
Deviations From Standard:	None
Measurement BW:	20 kHz
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 32 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 22.3 Test Limit

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the -20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the band 2400 to 2483.5 MHz may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the -20 dB bandwidth of the hopping channel, whichever is greater, provided that the systems operate with an output power no greater than 0.125 W.

## 22.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iii, the emissions of the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each nominal bandwidth.

**Figure iii Test Setup**

## 22.5 Test Equipment

Equipment Type	Manufacturer	Equipment Description	Element No	Due For Calibration
FSU46	R&S	Spectrum Analyser	REF910	2021-11-18

200	(25kHz or 2/3 Measured 20 dB Bandwidth kHz)	Pass

Channel separation observed  
8 Hopping channels LoRaWan 125 kHz channel

Measured Channel Spacing (kHz)	Limit	Result
200	(25kHz or 2/3 Measured 20 dB Bandwidth kHz)	Pass

### Channel separation 64 hopping channels LoRaWan 125 kHz channel

Date: 9.MAR.2021 11:28:48

### Channel separation 8 hopping channels LoRaWan 125 kHz channel

Date: 9.MAR.2021 11:05:59

## 23 Occupied Bandwidth

### 23.1 Definition

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal.

### 23.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 6.9
Frequencies Measured:	902.3 MHz/ 914.9 MHz / 927.5 MHz
EUT Channel Bandwidths:	125 kHz
Deviations From Standard:	None
Measurement BW: (requirement: 1 % to 5 % OBW)	3 kHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	10 kHz
Measurement Span: (requirement 2 to 5 times OBW)	300 kHz
Measurement Detector:	Peak

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 32 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6Vdc	

### 23.3 Test Limit

- For frequency hopping systems in the band 902 to 928 MHz: The maximum allowed -20 dB bandwidth of the hopping channel is 500 kHz.
- Frequency hopping systems operating in the band 5725 to 5850 MHz: The maximum -20 dB bandwidth of the hopping channel shall be 1 MHz

### 23.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vii, the bandwidth of the EUT was measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

**Figure vii Test Setup**

### 23.5 Test Equipment

## 24 Out-of-band and conducted spurious emissions

### 24.1 Definition

#### *Out-of-band emission.*

Emission on a frequency or frequencies immediately outside the necessary bandwidth that results from the modulation process but excluding spurious emissions.

#### *Spurious emission.*

Emission on a frequency or frequencies that are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products, and frequency conversion products, but exclude out-of-band emissions.

### 24.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Radio Laboratory
Test Standard and Clause:	ANSI C63.10-2013, Clause 7.8.8
Frequencies Measured:	902.3 MHz / 914.9 MHz / 927.5 MHz
EUT Channel Bandwidths:	125 kHz
Deviations From Standard:	None
Measurement BW:	100 kHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	300 KHz
Measurement Detector:	Peak
Measurement Range:	9 kHz to 10 GHz

### Environmental Conditions (Normal Environment)

Temperature: 22 °C	+15 °C to +35 °C (as declared)
Humidity: 34% RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 24.3 Test Limits

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in FCC 47CFR15.209(a) / RSS-Gen is not required.

#### 24.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure viii, the emissions from the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

**Figure viii Test Setup**

## 25 Radiated emissions

### 25.1 Definitions

#### *Spurious emissions*

Emissions on a frequency or frequencies, which are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products and frequency conversion products, but exclude out-of-band emissions.

#### *Restricted bands*

A frequency band in which intentional radiators are permitted to radiate only spurious emissions but not fundamental signals.

### 25.2 Test Parameters

Test Location:	Element Skelmersdale
Test Chamber:	Chamber 1
Test Standard and Clause:	ANSI C63.10-2013, Clause 6.5 and 6.6
EUT Frequencies Measured:	902.3 MHz/ 914.9 MHz/ 927.5 MHz
Deviations from Standard:	None
Measurement BW:	30 MHz to 1 GHz: 120 kHz; Above 1 GHz: 1 MHz
Measurement Detector:	Up to 1 GHz: quasi-peak; Above 1 GHz: RMS average and Peak

### Environmental Conditions (Normal Environment)

Temperature: 20 °C	+15 °C to +35 °C (as declared)
Humidity: 32 % RH	20 % RH to 75 % RH (as declared)
Supply: 3.6 Vdc	

### 25.3 Test Limit

Unwanted emissions that fall within the restricted frequency bands shall comply with the limits specified:

#### **General Field Strength Limits for License-Exempt Transmitters at Frequencies above 30 MHz**

<b>Frequency (MHz)</b>	<b>Field Strength (<math>\mu\text{V/m}</math> at 3 m)</b>	<b>Field Strength (dB<math>\mu\text{V/m}</math> at 3 m)</b>
30 to 88	100	40.0
88 to 216	150	43.5
216 to 960	200	46.0
Above 960	500	54.0

On frequencies below or equal to 1000 MHz, the limits shown are based on measuring equipment employing a CISPR quasi-peak detector function. On frequencies above 1000 MHz, the radiated emission limits are based on the use of measurement instrumentation employing an average detector function. The limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit.

## 25.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure i, the emissions from the EUT were measured on a spectrum analyzer / EMI receiver.

Radiated electromagnetic emissions from the EUT are checked first by preview scans. Preview scans for all spectrum and modulation characteristics are checked, using a peak detector and where applicable worst-case determined for function, operation, orientation, etc. for both vertical and horizontal polarisations. Pre-scan plots are shown with a peak detector and 100 kHz RBW.

If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.10 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed, (see EUT setup photographs for more detail).

Emissions between 30 MHz and 1 GHz are measured using calibrated broadband antennas. Emissions above 1 GHz are characterized using standard gain horn antennas. Pre-amplifiers and filters are used where required. Care is taken to ensure that test receiver resolution bandwidth, video bandwidth and detector type(s) meet the regulatory requirements.

For both horizontal and vertical polarizations, the EUT is then rotated through 360 degrees in azimuth until the highest emission is detected. At the previously determined azimuth the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected, this maximum value is recorded.

Power values measured on the test receiver / analyzer are converted to field strength, FS, in dBµV/m at the regulatory distance, using:

$$\text{Factor} = \text{AF} + \text{CL} - \text{PA}$$

Where,

PR is the power recorded on the receiver / spectrum analyzer in dBµV;

CL is the cable loss in dB;

AF is the test antenna factor in dB/m;

PA is the pre-amplifier gain in dB (where used);

DC is the duty correction factor in dB (where used, e.g. harmonics of pulsed fundamental);

CF is the distance factor in dB (where measurement distance different to limit distance);

This field strength value is then compared with the regulatory limit.

**Figure i Test Setup**

## 26 Measurement Uncertainty

### Radio Testing – General Uncertainty Schedule

All statements of uncertainty are expanded standard uncertainty using a coverage factor of 1.96 to give a 95 % confidence where no required test level exists.

Reference No.	Parameter	Description	Value	Unit
1	Adjacent Channel Power	Uncertainty in test result	<b>1.86</b>	dB
2	Carrier Power	Uncertainty in test result (Power Meter)	<b>0.070</b>	dB
		Uncertainty in test result (Spectrum Analyser)	<b>3.11</b>	
3	Effective Radiated Power	Uncertainty in test result	<b>4.71</b>	dB
4	Radiated Spurious Emissions	Uncertainty in test result 30 MHz to 1 GHz	<b>4.75</b>	dB
		1 GHz to 18 GHz	<b>4.46</b>	
5	Maximum Frequency Error	Uncertainty in test result (CMTA)	<b>113.441</b>	Hz
6	Radiated Emissions, Field Strength OATS 9 kHz – 110 GHz Electric Field	Uncertainty in test result (9 kHz – 30 MHz)	<b>2.3</b>	dB
		Uncertainty in test result (30 MHz – 1 GHz)	<b>4.75</b>	
		Uncertainty in test result (1 GHz – 18 GHz)	<b>4.46</b>	
		Uncertainty in test result (18 GHz – 26 GHz)	<b>3.2</b>	
		Uncertainty in test result (26 GHz – 40 GHz)	<b>3.3</b>	
		Uncertainty in test result (40 GHz – 50 GHz)	<b>3.5</b>	
		Uncertainty in test result (50 GHz – 75 GHz)	<b>3.6</b>	
Uncertainty in test result (75 GHz – 110 GHz)	<b>3.6</b>			
7	Frequency Deviation	Uncertainty in test result	<b>3.7</b>	%
8	Magnetic Field Emissions	Uncertainty in test result	<b>2.3</b>	dB
9	Conducted Spurious	Uncertainty in test result Up to 26 GHz	<b>0.921</b>	dB

<b>Reference No.</b>	<b>Parameter</b>	<b>Description</b>	<b>Value</b>	<b>Unit</b>
10	Channel Bandwidth	Uncertainty in test result	<b>15.71</b>	%
11	Spectrum Mask Measurements	Uncertainty in test result (frequency)	<b>2.59</b>	%
		Uncertainty in test result (amplitude)	<b>1.32</b>	dB
12	Adjacent Sub Band Selectivity	Uncertainty in test result	<b>1.24</b>	dB
13	Receiver Blocking – Listen Mode, Radiated	Uncertainty in test result	<b>3.23</b>	dB
14	Receiver Blocking – Talk Mode, Radiated	Uncertainty in test result	<b>3.36</b>	dB
15	Receiver Blocking – Talk Mode, Conducted	Uncertainty in test result	<b>1.24</b>	dB
16	Receiver Threshold	Uncertainty in test result	<b>3.42</b>	dB
17	Transmission Time Measurement	Uncertainty in test result	<b>4.40</b>	%

## 27 RF Exposure

### MPE Calculation

#### Prediction of MPE limit at a given distance

For purposes of these requirements mobile devices are defined by the FCC as transmitters designed to be used in other than fixed locations and to generally be used in such a way that a separation distance of at least 20 centimeters is normally maintained between radiating structures and the body of the user or nearby persons. These devices are normally evaluated for exposure potential with relation to the MPE limits. As the 20 cm separation specified under FCC rules may not be achievable under normal operation of the EUT, an RF exposure calculation is needed to show the minimum distance required to be less than the power density limit, as required under FCC rules.

Equation from IEEE C95.1

$$S = \frac{EIRP}{4 \pi R^2} \text{ re - arranged} \quad R = \sqrt{\frac{EIRP}{S 4 \pi}}$$

Where:

S = power density

R = distance to the centre of radiation of the antenna

EIRP = EUT Maximum power

Result

Channel Frequency (MHz)	EIRP (mW)	Power Density Limit (mW/cm <sup>2</sup> )	R (cm)	RF Exposure Evaluation
903.0	28	0.602	1.92	Not Required
915.0	29	0.610	1.95	Not Required
927.5	30	0.618	1.97	Not Required

## 28 RF Exposure

### RF EXPOSURE TECHNICAL BRIEF

#### RSS-102 issue 5

#### 2.5.2 Exemption Limits for Routine Evaluation – RF Exposure Evaluation

RF exposure evaluation is required if the separation distance between the user and/or bystander and the device's radiating element is greater than 20 cm, except when the device operates as follows:

- below 20 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 1 W (adjusted for tune-up tolerance);
- at or above 20 MHz and below 48 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than  $4.49/f^{0.5}W$  (adjusted for tune-up tolerance), where  $f$  is in MHz;
- at or above 48 MHz and below 300 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 0.6 W (adjusted for tune-up tolerance);
- at or above 300 MHz and below 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than  $1.31 \times 10^{-2} f^{0.6834} W$  (adjusted for tune-up tolerance), where  $f$  is in MHz;
- at or above 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 5 W (adjusted for tune-up tolerance).

Channel Frequency (MHz)	EIRP (W)	Exemption Limit (W)	RF Exposure Evaluation
903.0	0.028	1.37	Not Required
915.0	0.029	1.38	Not Required
927.5	0.030	1.40	Not Required
