## 1. ATTESTATION OF TEST RESULTS

**COMPANY NAME:** Waymo  
100 Mayfield Ave.  
Mountain View, CA 94043

**EUT DESCRIPTION:** E-Band Automotive Radar Sensor

**MODEL:** R6E

**SERIAL NUMBERS:** DV-0001691

**SAMPLE RECEIVE DATE:** 2021-06-01

**DATE TESTED:** 2021-06-02 to 2021-09-09

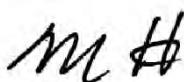

| APPLICABLE STANDARDS |                       | TEST RESULTS |
|----------------------|-----------------------|--------------|
| STANDARD             | FCC PART 95 SUBPART M | Compliant    |

UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document.

Approved & Released For  
UL LLC By:

Michael Heckrotte  
Principal Engineer  
Consumer Technology Division  
UL Verification Services

Tested By:

Mike Antola  
Staff Engineer  
Consumer Technology Division  
UL LLC

## 2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with following methods.

1. FCC CFR 47 Part 2
2. FCC CFR 47 Part 95M
4. ANSI C63.10-2020
5. ANSI C63.26-2015
6. KDB 653005 D01 76-81 GHz Radars v01r01
7. KDB 971168 D01 Power Meas. License Digital Systems v03r01

## 3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 12 Laboratory Dr., RTP, NC 27709, USA and 2800 Perimeter Park Dr., Suite B, Morrisville, NC 27560, USA. The following table identifies which facilities were utilized for radiated emission measurements documented in this report. Specific facilities are also identified in the test results sections.

| 2800 Perimeter Park Dr.                                | 12 Laboratory Dr.                      |
|--|--|
| <input checked="" type="checkbox"/> Chamber 1 - mmWave | <input type="checkbox"/> Chamber A RTP |
| <input type="checkbox"/> North Chamber                 | <input type="checkbox"/> Chamber C RTP |
| <input checked="" type="checkbox"/> South Chamber      |  |

The above test sites and facilities are covered under FCC Test Firm Registration # 703469.

Chamber 1 is a fully anechoic chamber dedicated to make measurements to TRP limits from 18-40 GHz, and field strength, EIRP and TRP measurements at and above 40 GHz. The measurement antenna is nominally 1.5 m high in accordance with C63.10-2013, procedures developed by the C63 mmWave Joint Task Group for inclusion in the next editions of C63.10 and C63.26, and applicable FCC KDB documents. The absorber reflectivity fully supports chamber performance over this frequency range. The dimensions of the chamber are approximately 6.7 m L by 3.7 m W by 3.1 m H.

## 4. CALIBRATION AND UNCERTAINTY

### 4.1. METROLOGICAL TRACEABILITY

All test and measuring equipment utilized to perform the tests documented in this report are calibrated on a regular basis, with a maximum time between calibrations of one year or the manufacturers' recommendation, whichever is less, and where applicable is traceable to recognized national standards.

### 4.2. DECISION RULES

The Decision Rule is based on Simple Acceptance in accordance with ISO Guide 98-4:2012 Clause 8.2. (Measurement uncertainty is not taken into account when stating conformity with a specified requirement.)

### 4.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

| PARAMETER   | U <sub>LAB</sub> |
|---|------------------|
| Worst Case Radiated Disturbance, 9 kHz to 30 MHz    | 2.84 dB          |
| Worst Case Radiated Disturbance, 30 to 1000 MHz     | 6.01 dB          |
| Worst Case Radiated Disturbance, 1000 to 18000 MHz  | 4.73 dB          |
| Worst Case Radiated Disturbance, 18000 to 26000 MHz | 4.51 dB          |
| Worst Case Radiated Disturbance, 26000 to 40000 MHz | 5.29 dB          |
| Worst Case Radiated Disturbance >40000 MHz          | 2.89 dB          |
| Temperature   | ±0.57 %          |
| Voltages  | ±0.57 %          |

Uncertainty figures are valid to a confidence level of 95%.

## 5. EQUIPMENT UNDER TEST

### 5.1. DESCRIPTION OF EUT

The EUT is a radar sensor, operating in 76 - 81 GHz band, with a digital beam-forming scanning antenna. Four modes of each range for operation are available as shown.

| Mode    | Frequency (GHz) | Modulation Type |
|---------|-----------------|-----------------|
| LRES W6 | 77.103 – 79.663 | FMCW            |
| LRES W4 | 77.103 – 79.663 | FMCW            |
| MRES    | 77.232 – 79.792 | FMCW            |
| HRES    | 77.411 – 79.731 | FMCW            |

The EUT is powered by an external power supply with nominal voltage of 12 VDC.

### 5.2. SOFTWARE AND FIRMWARE

EUT Firmware versions: 382046355

The software used on the support laptop is WaymoRade6eTester.sh.

### 5.3. OUTPUT POWER

The highest LRES W6 Peak radiated output power is 37.52 dBm EIRP.

The highest LRES W6 Average radiated output power is 26.06 dBm EIRP.

The highest LRES W4 Peak radiated output power is 36.30 dBm EIRP.

The highest LRES W4 Average radiated output power is 25.73 dBm EIRP.

The highest MRES Peak radiated output power is 36.99 dBm EIRP.

The highest MRES Average radiated output power is 24.74 dBm EIRP.

The highest HRES Peak radiated output power is 38.15 dBm EIRP.

The highest HRES Average radiated output power is 25.80 dBm EIRP.

### 5.4. DESCRIPTION OF AVAILABLE ANTENNAS

The EUT utilizes an integral antenna with dimension of 29 mm x 2 mm x 1 mm. The antenna has a 15.1 dBi gain.

## 5.5. MODULATION FORMAT

Modulation is FMCW and parameters are as follows:

| Mode    | Approx. Chirp Width (MHz) | Waveform Up Chirp Sweep Time (us) | Waveform Down Chirp Sweep Time (us) |
|---------|---------------------------|-----------------------------------|-------------------------------------|
| LRES W6 | 95                        | 12                                | None                                |
| LRES W4 | 118                       | 12                                | None                                |
| MRES    | 362                       | 24                                | None                                |
| HRES    | 616                       | 12                                | None                                |

## 5.6. DESCRIPTION OF TEST SETUP

### TEST SETUP

The EUT was connected to a laptop computer. All testing was performed using customer-provided software that was utilized to enable continuous Tx modulated operation.

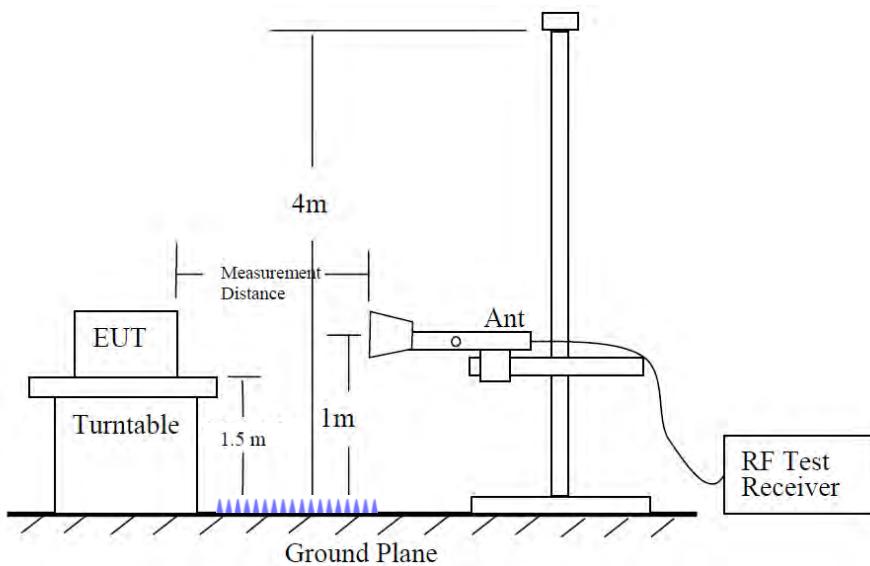

## SETUP DIAGRAM FOR TESTS

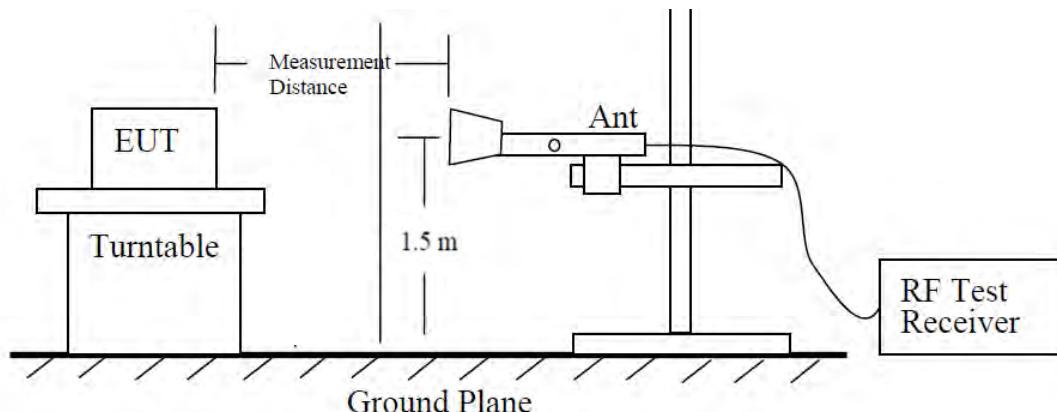

**TEST SITE DIAGRAM – Below 1 GHz**

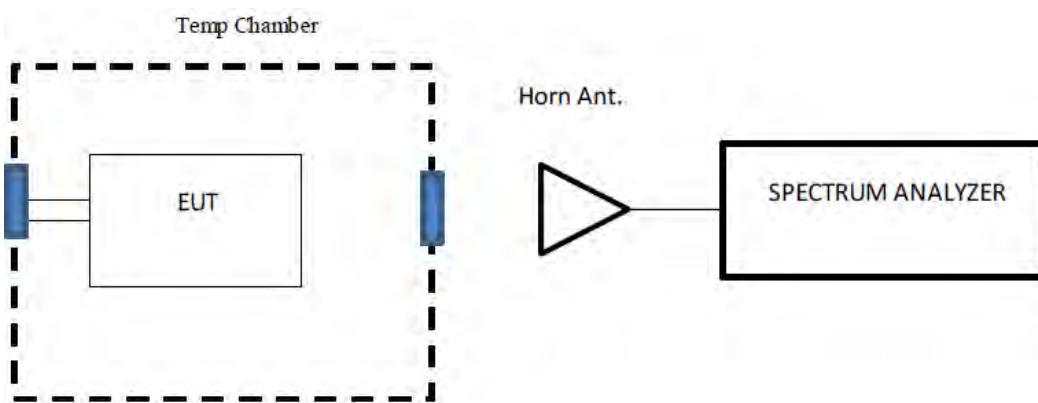

**TEST SITE DIAGRAM – 1-18 GHz**

### TEST SITE DIAGRAM – Above 18 GHz & mmWave

### FREQUENCY STABILITY

## **FAR-FIELD DISTANCE AND MEASUREMENT DISTANCE**

The equipment under test was transmitting while connected to its integral antenna and is placed on a turntable.

The measurement distance is in the far field per formula  $2D^2/\lambda$  where D is the larger dimension of the antenna.

For fundamental / band edge emissions, the largest far-field distance of either the EUT antenna or measurement antenna shall be used. For above 18 GHz spurious emissions, the far-field distance will be based on the measured antenna. In this case, the measurement antenna has the largest far-field distance. The EUT is manipulated through all orthogonal planes representative of its typical use to achieve the highest EIRP reading on the receive spectrum analyzer.

| Frequency Range (GHz) | Wavelength (m) | Rx Antenna Diagonal dim. (m) | Far Field Distance (m) | Measurement Distance Used (m) |
|-----------------------|----------------|------------------------------|------------------------|-------------------------------|
| 40-50                 | 0.0060         | 0.069                        | 1.61                   | 3.00                          |
| 50-75                 | 0.0040         | 0.046                        | 1.05                   | 3.00                          |
| 75-110                | 0.0027         | 0.031                        | 0.70                   | 3.00                          |
| 110-170               | 0.0018         | 0.02                         | 0.46                   | 3.00                          |
| 170-243               | 0.0012         | 0.013                        | 0.31                   | 0.50                          |

Radiated spurious emissions limits above 40 GHz are based on a 3-meter measurement distance. As such, testing from 40-170 GHz was performed at 3-meters. Above 170 GHz, testing was performed at a 0.5-meter distance and the data was corrected, accordingly, to the 3-meter limit.

In-band testing was performed at a 2-meter distance, which was still in the far-field based on the maximum EUT / measurement antenna dimension.

Radiated power levels are investigated while the receive antenna was rotated through all angles to determine the worst-case polarization/positioning. The worse-case orientation of the EUT was with the front fact facing the RX antenna, which was polarized vertically. Refer to test setup photos exhibit (report number R13824181-EP1) for details.

## 6. TEST AND MEASUREMENT EQUIPMENT

The following test and measurement equipment was utilized for the tests documented in this report:

Test Equipment Used - mmWave Test Equipment (Morrisville – mmWave 1)

| Equip. ID | Description                      | Manufacturer/Brand    | Model Number              | Last Cal.  | Next Cal.  |

\*- All horn antennas at and above the 33-50 GHz band are standard gain horns. In accordance with ANSI C63.10 clause 4.4.3 (a) Standard gain horns need not be periodically recalibrated, unless damage or deterioration is suspected or known to have occurred. If a standard gain horn is not periodically recalibrated, then its critical dimensions (see IEEE Std 1309-2005) shall be verified and documented on an annual basis.

UL measures the critical dimensions on an annual basis and checks for damage and deterioration before each test.

All equipment was within calibration during the time of test.

## 8. APPLICABLE LIMITS AND TEST RESULTS

### 8.1. DUTY CYCLE

#### LIMIT

None; for reporting purposes only.

#### TEST PROCEDURE

The fundamental is measured using a Standard Gain Horn Antenna, Low Noise Amplifier and a Diode Detector connected to an Oscilloscope. Pulse widths, burst lengths, and periods are measured, then the duty cycle is calculated.

#### RESULTS

Duty cycle linear = on/off time

Duty cycle % = Duty cycle linear \* 100

| Mode    | ON Time (msec) | Period (msec) | Duty Cycle (linear) | Duty Cycle (%) |
|---------|----------------|---------------|---------------------|----------------|
| LRES W6 | 23.741         | 57.57         | 0.412               | 41%            |
| LRES W4 | 21.197         | 59.09         | 0.359               | 36%            |
| MRES    | 18.826         | 53.78         | 0.350               | 35%            |
| HRES    | 21.061         | 56.4          | 0.373               | 37%            |

DUTY CYCLE

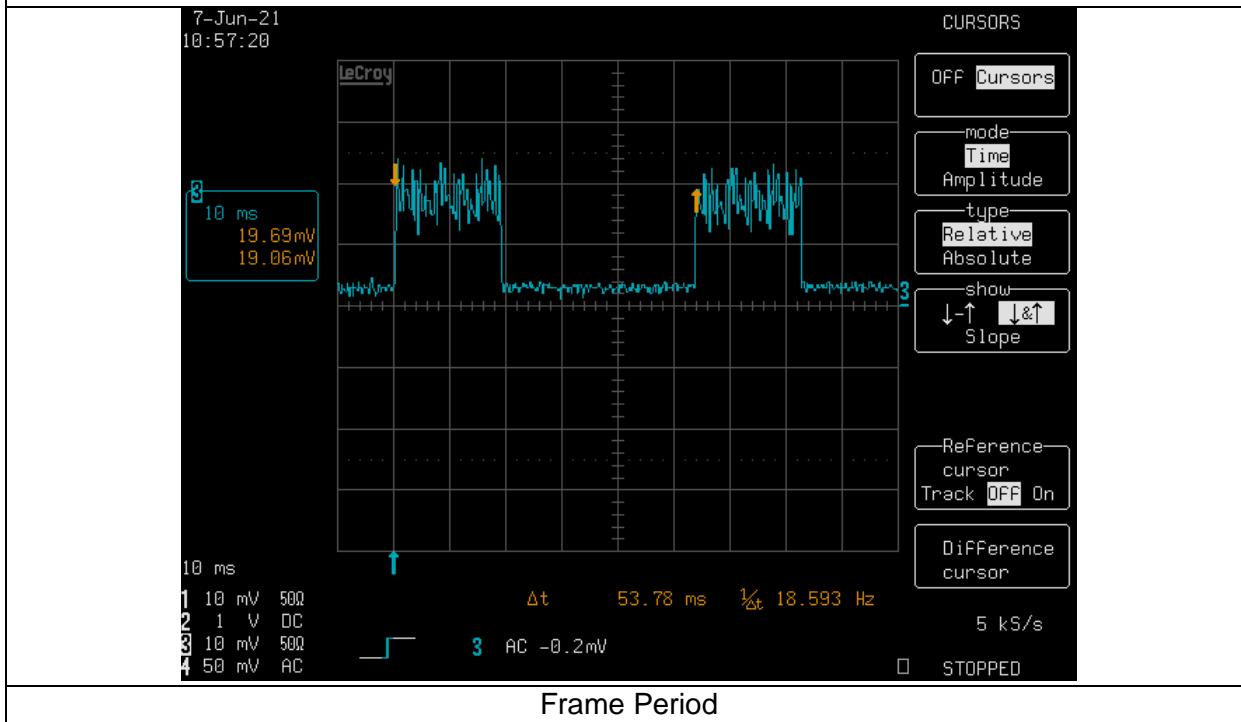

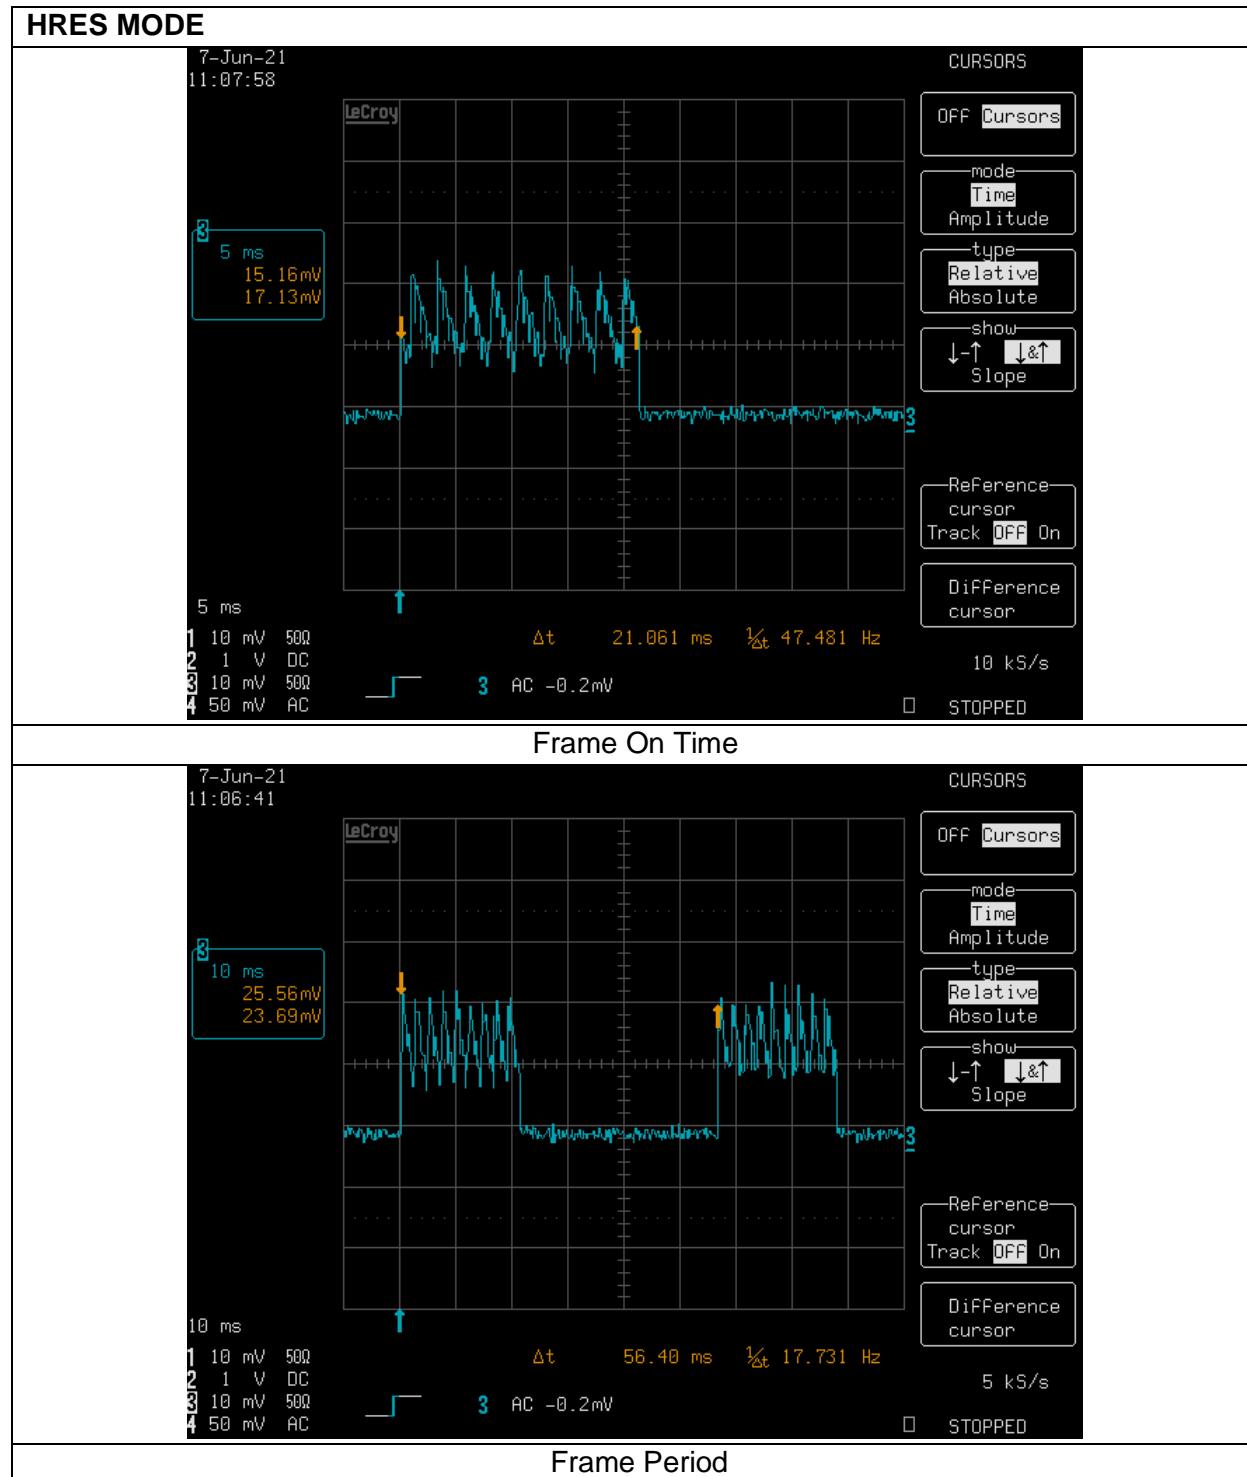

### MRES MODE

Frame On Time

Frame Period

## 8.2. OCCUPIED BANDWIDTH

### REQUIREMENT

FCC: §2.1049  
FCC §95.3379 (b)

### LIMIT

The radar device's occupied bandwidth (99% emission bandwidth) shall be contained in the 76-81GHz frequency band.

### TEST PROCEDURES

99% bandwidth measurement function of the signal analyzer was used to measure 99% occupied.

- RBW = 1 – 5% of OBW
- VBW  $\geq$  3 x RBW
- Span = Wide enough to capture all modulation products including the emission skirts
- Detector = Peak
- Trace mode = max hold
- Sweep = auto couple
- The trace was allowed to stabilize

ANSI C63.26-2015 Clause 5.4

All modes of operations were investigation and results are reported in this section.

### RESULTS

See the following pages.

### 8.3. PEAK AND AVERAGE RADIATED POWER

#### REQUIREMENT

FCC: §2.1046, §95.3367 (a) (b)

#### LIMIT

FCC §95.3367 - The fundamental radiated emission limits within the 76-81 GHz band are expressed in terms of Equivalent Isotropically Radiated Power (EIRP) and are as follows:

(a) The maximum power (EIRP) within the 76-81 GHz band shall not exceed 50 dBm based on measurements employing a power averaging detector with a 1 MHz Resolution Bandwidth (RBW).

(b) The maximum peak power (EIRP) within the 76-81 GHz band shall not exceed 55 dBm based on measurements employing a peak detector with a 1 MHz RBW.

#### TEST PROCEDURES

##### Peak Power

Radiated power measurements are performed with the signal analyzer's set to spectrum analyzer mode.

- RBW = 1 MHz
- VBW  $\geq$  3 x RBW
- Span = 2x to 3x the OBW
- Number of measurement points in sweep > 2 x span / RBW
- Sweep time = 2 x (Signal Period) x (Span / RBW)
- Detector = Peak
- Trace mode = Max Hold
- Set reference level as required
- Set marker on the signal peak after trace has stabilized

Worse-case Signal Period of all modes is 59.09ms, thus sweep times are:

Signal Period (ms): 59.09

| Mode    | SPAN (MHz) | RBW (MHz) | Swp Time (ms) | Swp Time (s) | Actual Swp Time Used (s) |
|---------|------------|-----------|---------------|--------------|--------------------------|
| LRS W6  | 300        | 1         | 35454         | 35.5         | 120                      |
| LRES W4 | 300        | 1         | 35454         | 35.5         | 120                      |
| MRES    | 1000       | 1         | 118180        | 118.2        | 200                      |
| HRES    | 1500       | 1         | 177270        | 177.3        | 200                      |

### Average Power

Radiated power measurements are performed using the signal analyzer's "channel power" measurement capability for signals with continuous operation.

- RBW = 1 – 5% of the OBW, not to exceed 1 MHz
- VBW  $\geq$  3 x RBW
- Span = 2x to 3x the OBW
- Number of measurement points in sweep > 2 x span / RBW
- Sweep time = 5 x (Signal Period) x (Span / RBW)
- Detector = RMS
- Power shall be integrated over the OBW

Worse-case Signal Period of all modes is 59.09ms, thus sweep times are:

Signal Period (ms): 59.09

| Mode    | SPAN (MHz) | RBW (MHz) | Swp Time (ms) | Swp Time (s) | Actual Swp Time Used (s) |
|---------|------------|-----------|---------------|--------------|--------------------------|
| LRS W6  | 300        | 1         | 88635         | 88.6         | 300                      |
| LRES W4 | 300        | 1         | 88635         | 88.6         | 300                      |
| MRES    | 1000       | 1         | 295450        | 295.5        | 300                      |
| HRES    | 1500       | 1         | 443175        | 443.2        | 500                      |

KDB 653005 D01 76-81 GHz Radars v01r01 Section 4 a) b) c)

ANSI C63.26-2015 Clause 5.2, Clause 5.5, Clause 6.4, and Annex C.5.2

ANSI C63.10-2020 Clause 9, Annex C, Annex L

Measurements are made at a distance greater than or equal to the far field boundary distance. The measured power level is converted to EIRP based on the following:

$$\text{EIRP} = P_R + L_P$$

where,

$P_R$  is the adjusted received power, after corrections

$L_P$  is the basic free space propagation path loss

EIRP was calculated using the equations of ANSI C63.26-2015 Annex C.5.2. The total correction factors from 76-81 GHz range of horn antenna gain, cable loss, etc. were calculated using equation C.8. Then, EIRP was calculated using equation C.9 with Path Loss ( $L_P$ ) @ 2m, 77 GHz.

Sample calculation of EIRP:

$$\begin{aligned}\text{Total Correction Factor} &= \text{Cable Loss (dB)} - \text{Horn Ant Gain (dBi)} + \text{Ext. Atten. (dB)} - \text{Ext. Amp. (dB)} \\ &= 4 - 23 + 0 - 0 = -19 \text{ dB}\end{aligned}$$

$$\begin{aligned}P_R &= P_{\text{meas}} (\text{dBm}) + \text{Total Correction Factor} \\ &= -30 + (-19) = -49 \text{ dBm}\end{aligned}$$

$$\begin{aligned}L_P &= 20\log(F) + 20\log(d) - 27.5 \\ &= 20\log(77000) + 20\log(2) - 27.5 = 76 \text{ dB}\end{aligned}$$

$$\begin{aligned}\text{EIRP} &= P_R (\text{dBm}) + L_P (\text{dB}) \\ &= -49 + 76 = 27 \text{ dBm}\end{aligned}$$

Radiated power levels are investigated while the receive antenna was rotated through all angles to determine the worst-case polarization/positioning. Additionally, the EUT was rotated along its horizontal and vertical axis. The worse-case orientation of the EUT was with the front face facing the RX antenna, which was polarized vertically. Refer to test setup photos exhibit (report number R13824181-EP1) for details.

### **FAR FIELD BOUNDARY CALCULATIONS**

The far-field boundary is given as:

$$R_{\text{far field}} = (2 * L^2) / \lambda$$

where,

L = Largest Antenna Dimension, including the reflector, in meters

$\lambda$  = wavelength in meters

The largest dimension of the integral TX array antenna is 29 mm, which is smaller than the maximum dimension of the measurement antenna (31 mm). As such, 31 mm is the dimension that is used in determining the far-field boundary.

| Frequency (GHz) | L (m)  | Lambda (m) | R (Far Field) (m) |
|-----------------|--------|------------|-------------------|
| 79.792          | 0.0310 | 0.0038     | 0.51              |

Radiated power measurements are performed at a 2-meter test distance.

## FMCW CORRECTION FACTOR FOR PEAK DETECTION

Keysight Technologies Application Note 5952-1039 "Spectrum and Signal Analysis Pulsed RF" provides the derivation of the FMCW Desensitization Factor for Gaussian-shaped Resolution Bandwidth Filters in Appendix B "IF Amplifier Response and Distortion".

Equation B-10 is excerpted:

$$\alpha = \frac{1}{\sqrt[4]{1 + \left(\frac{2\ln(2)}{\pi}\right)^2 \left(\frac{F_s}{T_s B^2}\right)^2}} \quad (\text{B-10})$$

Where

$\alpha$  is the reduction in amplitude

$F_s$  = FMCW Chirp Bandwidth

$T_s$  = FMCW Chirp Time

$B$  = 3 dB IF Bandwidth = RBW

## FMCW Correction Factor for Peak Detection

| Mode    | Start Freq (GHz) | Stop Freq (GHz) | Center Freq (GHz) | FMCW Width (MHz) | Ramp Time (us) | RBW (MHz) | Amplitude Loss (lin) | Correction Factor (dB) |

Total Corr Factor (dB) = Cable Loss - Rx Antenna Gain - Premp Gain + Mixer Loss + Waveguide Loss

Peak Power (dBm EIRP) = Measured Power + Total Corr Factor + Free Space Loss + Normalized Sweep Rate Correction

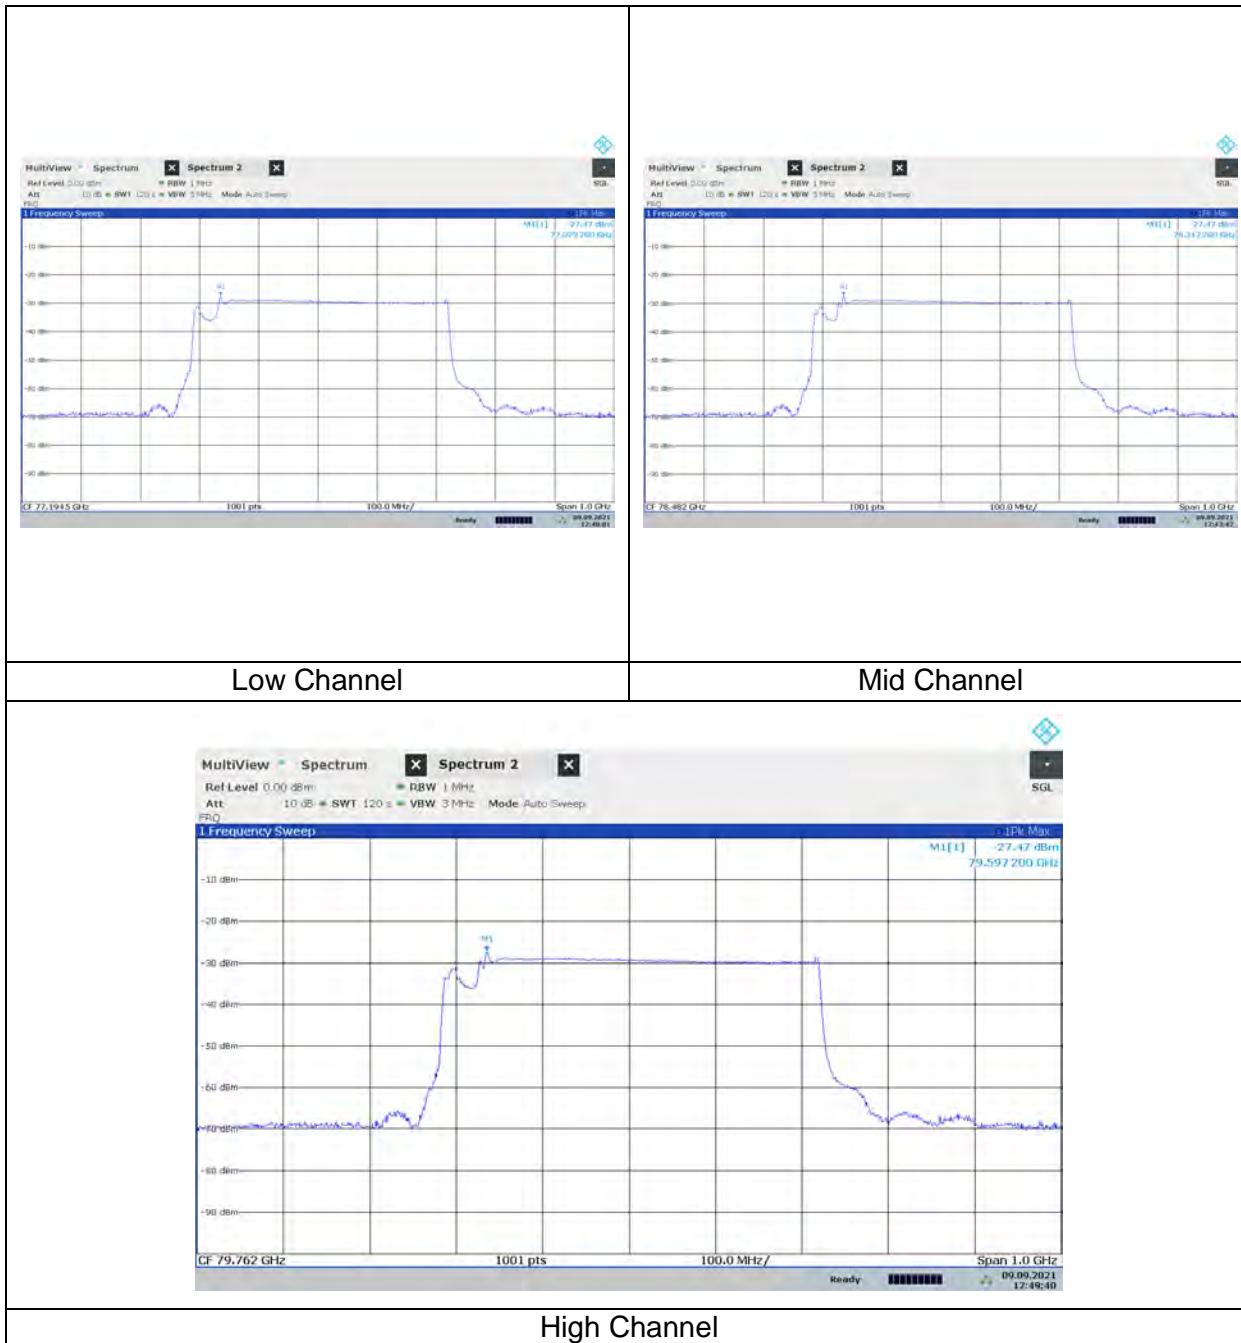

## PEAK EIRP - LRES W6 MODE

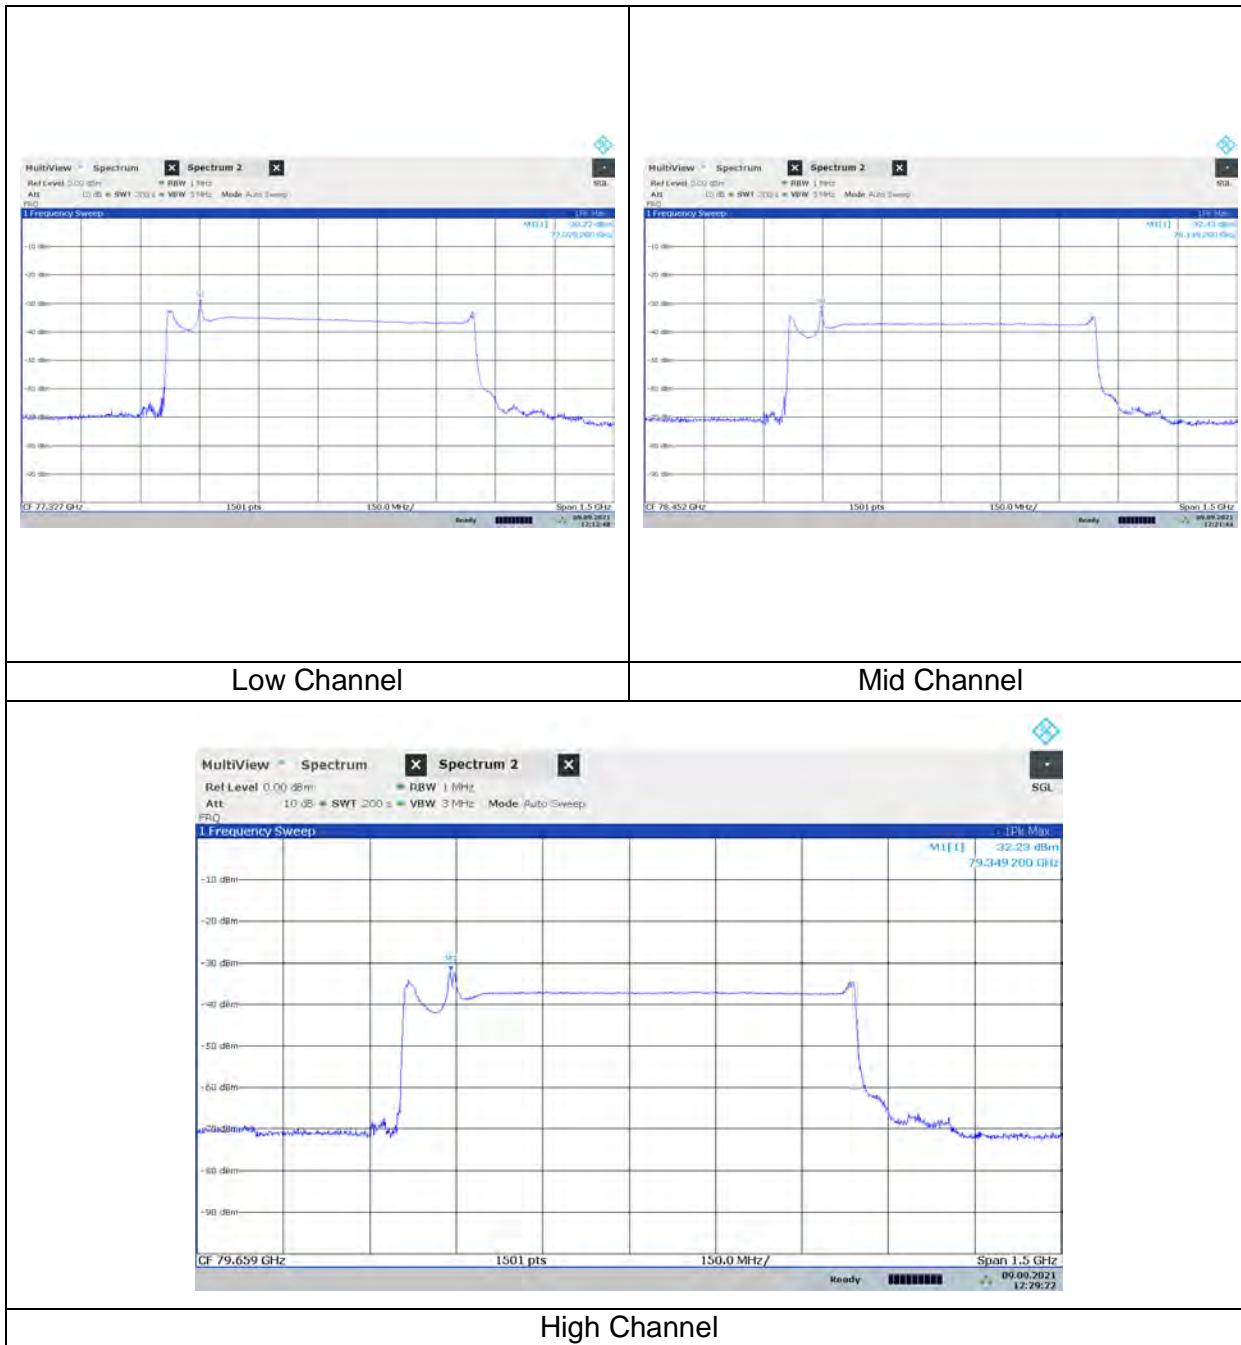

**PEAK EIRP - LRES W4 MODE**

## PEAK EIRP - MRES MODE

## PEAK EIRP - HRES MODE

## 8.4. RADIATED SPURIOUS EMISSIONS

### REQUIREMENT

FCC: §95.3379

### LIMIT

95.3379 - (a)(1) Radiated emissions below 40 GHz shall not exceed the field strength as shown in the following emissions table

| Frequency (MHz) | Field Strength (uV/m) | Field Strength (dBuV/m) | Measurement Distance (meters) |
|-----------------|-----------------------|-------------------------|-------------------------------|
| 0.009-0.490     | 2400/F (kHz)          | 48.5-13.8               | 300                           |
| 0.490-1.705     | 24000/F (kHz)         | 49.0-23.0               | 30                            |
| 1.705-30.0      | 30                    | 29.5                    | 30                            |
| 30-88           | 100                   | 40.0                    | 3                             |
| 88-216          | 150                   | 43.5                    | 3                             |
| 216-960         | 200                   | 46.0                    | 3                             |
| Above 960       | 500                   | 54.0                    | 3                             |

90.3379 - (a)(2) The power density of radiated emissions outside the 76-81 GHz band above 40.0 GHz shall not exceed the following, based on measurements employing an average detector with a 1 MHz RBW:

- (i) For radiated emissions outside the 76-81 GHz band between 40 GHz and 200 GHz from field disturbance sensors and radar systems operating in the 76-81 GHz band: 600 pW/cm<sup>2</sup> at a distance of 3 meters from the exterior surface of the radiating structure.
- (ii) For radiated emissions above 200 GHz from field disturbance sensors and radar systems operating in the 76-81 GHz band: 1000 pW/cm<sup>2</sup> at a distance of 3 meters from the exterior surface of the radiating structure.
- (3) For field disturbance sensors and radar systems operating in the 76-81 GHz band, the spectrum shall be investigated up to 231.0 GHz.

NOTE: Testing was performed up to 243 GHz per the recommendation of KDB 653005.

The limits above 40 GHz were converted to dBm EIRP as follows:

|   |         |         |
|---|---------|---------|
| Limit Distance (cm)                       | 300     | 300     |
| Power Density Limit (pW/cm <sup>2</sup> ) | 600     | 1000    |
| EIRP Limit (W)                            | 0.00068 | 0.00113 |
| EIRP Limit (dBm)                          | -1.7    | 0.5     |

$$\text{EIRP (mW)} = S * 4 * \pi * D^2$$

$$\text{EIRP (dBm)} = 10 * \log [\text{EIRP (mW)} * 1000]$$

Where,      S = Power density in mW/cm<sup>2</sup>  
                  D = Separation distance in cm

## **TEST PROCEDURE**

KDB 653005 D01 76-81 GHz v01r01 Section 4 (e)  
ANSI C63.26-2015 Clause 5.5.4 and Annex C.5.2.

RSE was investigated from 9 kHz – 243 GHz for FCC.

### **Testing below 40 GHz:**

The EUT is placed on a non-conducting table 80 cm above the ground plane for measurement below 1 GHz; 1.5 m above the ground plane for measurement above 1GHz. The antenna to EUT distance is 3 meters. The EUT is configured in accordance with ANSI C63.26 and set to transmit in a continuous mode.

For measurements below 1 GHz the resolution bandwidth is set to 100 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements in the 30-1000MHz range, 9kHz for peak and/or quasi-peak detection measurements in the 0.15-30MHz range and 200Hz for peak and/or quasi-peak detection measurements in the 9 to 150kHz range. Peak detection is used unless otherwise noted as quasi-peak or average (9-90kHz and 110-490kHz).

For pre-scans above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz for peak measurements.

For final measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz for peak measurements; as applicable for linear voltage averaging measurements.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

3D antenna use - For below 30MHz testing, investigation was done on three antenna orientations (parallel, perpendicular, and ground-parallel).

Base on FCC 15.31 (f) (2): measurements may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurements in the near field.

## **KDB 414788 Open Field Site(OFS) and Chamber Correlation Justification**

OFS and chamber correlation testing had been performed and chamber measured test result is the worst-case test result.

Testing above 40 GHz:

All radiated spurious emissions were measured as EIRP to compare with the limits as defined above.

The average EIRP reported below is calculated per section 5.2.7 of ANSI C63.26-2015 which states:  $EIRP (\text{dBm}) = E (\text{dB}\mu\text{V/m}) + 20\log(D) - 104.8$ ; where D is the measurement distance (in the far field region) in m. The field strength E is calculated  $E (\text{dB}\mu\text{V/m}) = \text{Spectrum Analyzer Level} (\text{dBm}) + \text{Antenna Factor} (\text{dB/m}) + \text{Cable Loss} (\text{dB}) + 107$ . All appropriate Antenna Factor and Cable Loss have been applied in the spectrum analyzer for each measurement.

RSEs above 40 GHz were measured at the appropriate far field distances listed on Section 5 on this report (FAR-FIELD DISTANCE AND MEASUREMENT DISTANCE). Then, the EIRP of RSE was calculated using the equations on ANSI C63.26-2015 Annex C.5.2, as described on Sections 8.2 and 8.3.

RSEs from 40 – 50 GHz were measured using a spectrum analyzer or EMI receiver with an internal preamplifier when applicable. Emissions above 50 GHz were measured using a downconverter with spectrum analyzer, while an external LNA was used when applicable.

Worse-Case Configuration

All RSEs were measured for the configuration with the highest EIRP as representing the worst case. Preliminary radiated emissions tests on the low, middle and high channels indicated that the worst case radiated spurious emissions were on the channel with the highest power (low channel) and so only the test data for that channel is included in this report.

**RESULTS**

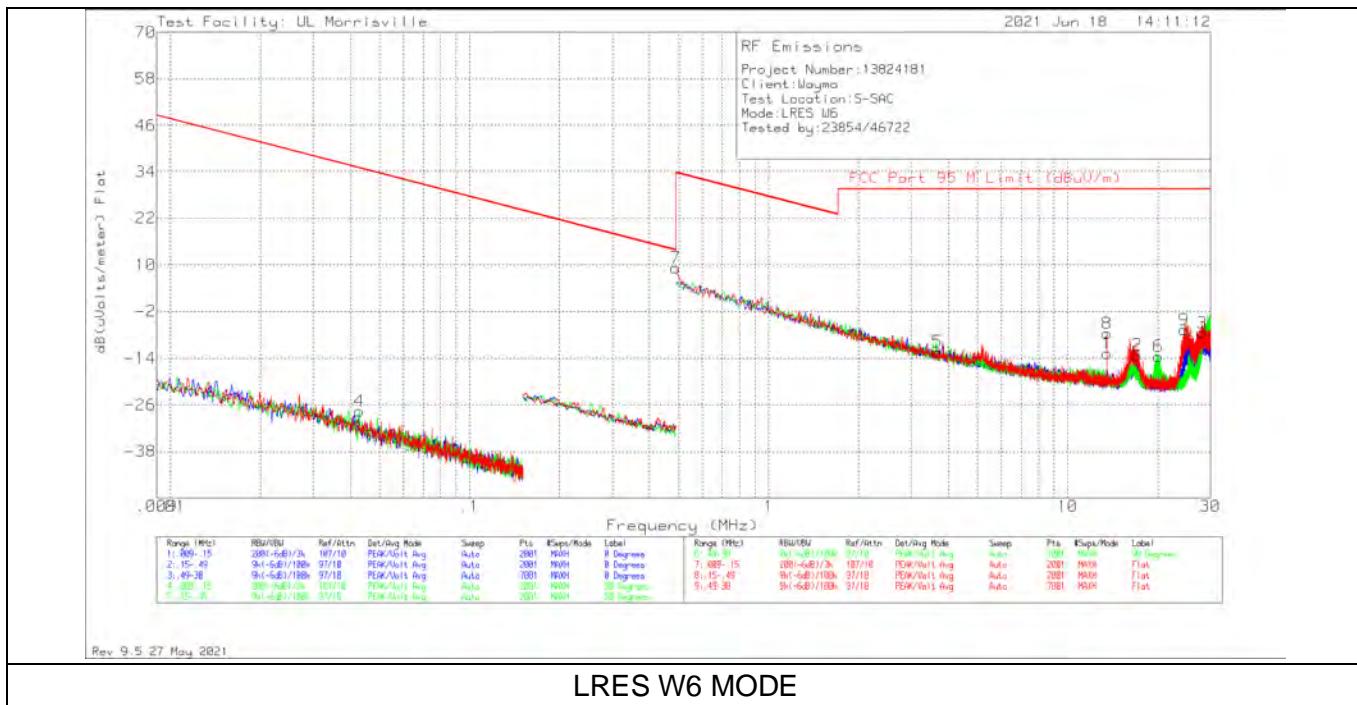

See the following pages.

**TESTED BY**

Below 40 GHz Test Site: South Chamber  
Employee IDs: 23854, 11322  
Date: 2021-06-14 to 2021-07-13

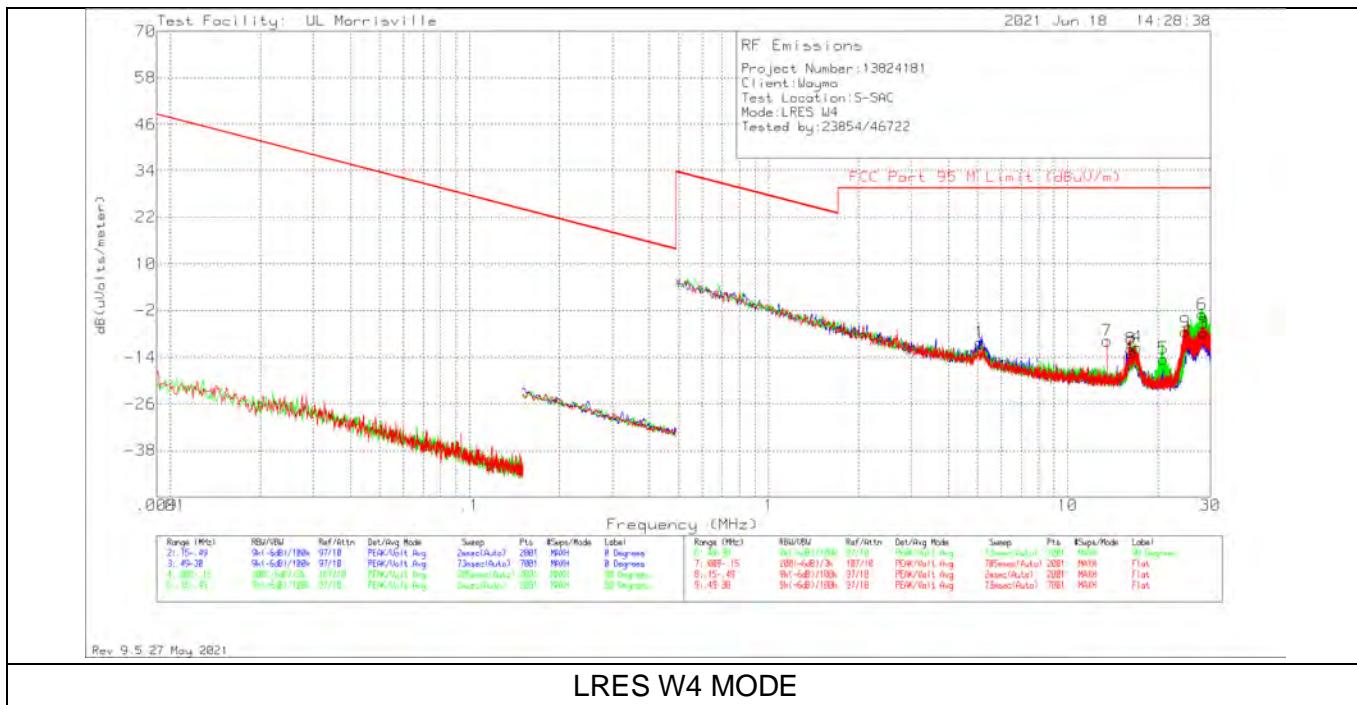

Above 40 GHz Test Site: Chamber 1 - mmWave  
Employee IDs: 23854  
Date: 2021-06-09 to 2021-06-24

| LRES W4 | 81.000          | Peak     | Vert     | -27.51          | -1.7             | -25.81      |

Note: Only worse case of horizontal / vertical measurement reported.

| Mode | Frequency (GHz) | Detector | Polarity | Peak (dBm EIRP) | Limit (dBm EIRP) | Margin (dB) |
|------|-----------------|----------|----------|-----------------|------------------|-------------|
| MRES | 81.000          | Peak     | Horiz    | -27.87          | -1.7             | -26.17      |
| HRES | 81.000          | Peak     | Vert     | -28.65          | -1.7             | -26.95      |

## 8.5. FREQUENCY STABILITY

### REQUIREMENT

FCC: §2.1055

FCC §95.3379 (b) – F (low) > 76.0 GHz ; F (high) < 81 GHz

Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation. Equipment is presumed to operate over the temperature range -20 to +50 degrees Celsius with an input voltage variation of 85% to 115% of rated input voltage, unless justification is presented to demonstrate otherwise.

### TEST PROCEDURES

ANSI C63.26-2015 Section 5.6

The 99% occupied bandwidth was measured using the occupied bandwidth function of the spectrum analyzer. The lower side of the low channel was compared to the lower limit (76 GHz) and the higher side of the high channel was compared to the higher limit (81 GHz).

### RESULTS

See the following page.

Plots only reported for the mode which utilized the widest bandwidth (HRES). Additionally, plots only reported at the extreme & nominal conditions. Numerical results for the remaining modes/environmental conditions are provided in the following tables.

### TESTED BY

Employee ID: 23854  
Location: mmWave 1  
Date: 2021-06-16, 2021-06-17
