#### FCC PART 15 SUBPART C TEST REPORT

**FCC PART 15.247** 

Compiled by

( position+printed name+signature)..: File administrators Zoey Cao

Supervised by

( position+printed name+signature)..: Project Engineer Amy Wen

Approved by

( position+printed name+signature)..: RF Manager Eric Wang

Date of issue....... Nov. 24, 2023

Testing Laboratory Name ...... Shenzhen CTA Testing Technology Co., Ltd.

Fuhai Street, Bao'an District, Shenzhen, China

Applicant's name...... SHENZHEN STARWAVE INDUSTRIAL TECHNOLOGY CO., LTD

1505 Floor 15, Huaide International Building, No.73, Fuyong

Address ...... Section, Guangshen Road, Huaide Community, Fuyong Street,

Bao'an District, Shenzhen, China

Test specification .....:

Standard ..... FCC Part 15.247

#### Shenzhen CTA Testing Technology Co., Ltd. All rights reserved.

Test item description ...... Wireless Silent Mouse

Trade Mark .....: MINISO

Manufacturer ...... SHENZHEN STARWAVE INDUSTRIAL TECHNOLOGY CO.,LTD

Model/Type reference.....: LW-8

Listed Models .....: LW-YZW-1

Modulation .....: GFSK

Frequency...... From 2402MHz to 2480MHz

Rating ...... DC 1.5V From battery

Result.....: PASS

Page 2 of 39 Report No.: CTA23111700201

#### TEST STANDARDS 1

The tests were performed according to following standards:

FCC Rules Part 15.247: Frequency Hopping, Direct Spread Spectrum and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz. ANSI C63.10-2013: American National Standard for Testing Unlicensed Wireless Devices

| CIA   |   |   |                              |     |             |  |  |  |
| DC 1.5V from battery  |   |   |                              |     |             |  |  |  |
| 2.4 Short description of the Equipment under Test (EUT)                                   |   |   |                              |     |             |  |  |  |
| This is a Wireless Silent Mouse.  For more details, refer to the user's manual of the EUT |   |   |                              |     |             |  |  |  |

#### Short description of the Equipment under Test (EUT)

For more details, refer to the user's manual of the EUT.

#### 2.5 **EUT operation mode**

The Applicant provides communication tools software(Engineer mode) to control the EUT for staying in continuous transmitting (Duty Cycle more than 98%) and receiving mode for testing .There are 79 channels CTATES provided to the EUT and Channel 00/39/78 were selected to test.

Page 6 of 39 Report No.: CTA23111700201

Operation Frequency:

| CTA  | Channel | Frequency (MHz) |
|--|---------|-----------------|

| 57117  | 77      | 2479            |
|  | 78      | 2480            |

#### **Block Diagram of Test Setup** 2.6

#### Related Submittal(s) / Grant (s) 2.7

This submittal(s) (test report) is intended for the device filing to comply with Section 15.247 of the FCC Part 15, CTA TESTING Subpart C Rules.

#### 2.8 **Modifications**

No modifications were implemented to meet testing criteria.

Page 7 of 39 Report No.: CTA23111700201

# TEST ENVIRONMENT

### Address of the test laboratory

#### Shenzhen CTA Testing Technology Co., Ltd.

Room 106, Building 1, Yibaolai Industrial Park, Qiaotou Community, Fuhai Street, Bao'an District, Shenzhen, China

#### 3.2 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

#### FCC-Registration No.: 517856 Designation Number: CN1318

Shenzhen CTA Testing Technology Co., Ltd. has been listed on the US Federal Communications Commission list of test facilities recognized to perform electromagnetic emissions measurements.

Shenzhen CTA Testing Technology Co., Ltd. has been listed by American Association for Laboratory
Accreditation to perform electromagnetic emission measurement

#### **CAB identifier: CN0127** ISED#: 27890

Shenzhen CTA Testing Technology Co., Ltd. has been listed by Innovation, Science and Economic Development Canada to perform electromagnetic emission measurement.

The 3m-Semi anechoic test site fulfils CISPR 16-1-4 according to ANSI C63.10 and CISPR 16-1-4:2010.

#### 3.3 Environmental conditions

CTA TESTING During the measurement the environmental conditions were within the listed ranges:

#### Radiated Emission:

| tadiatoa Erinoolorii  |              |
|-----------------------|--------------|
| Temperature:          | 24 ° C       |
|                       |              |
| Humidity:             | 45 %         |
|                       |              |
| Atmospheric pressure: | 950-1050mbar |

#### AC Power Conducted Emission:

| Temperature:          | 25 ° C       |
|-----------------------|--------------|
| TES!                  |              |
| Humidity:             | 46 %         |
| CAN U.                |              |
| Atmospheric pressure: | 950-1050mbar |

#### Remark:

- The measurement uncertainty is not included in the test result. 1.
- We tested all test mode and recorded worst case in report

#### 3.5 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities. The measurement uncertainty was calculated for all measurements listed in this test report acc. to TR-100028-01" Electromagnetic compatibility and Radio spectrum Matters (ERM);Uncertainties in the measurement of mobile radio equipment characteristics; Part 1" and TR-100028-02 "Electromagnetic compatibility and Radio spectrum Matters (ERM);Uncertainties in the measurement of mobile radio equipment characteristics; Part 2 " and is documented in the Shenzhen CTA Testing Technology Co., Ltd. quality system acc. to DIN EN ISO/IEC 17025. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

Hereafter the best measurement capability for Shenzhen CTA Testing Technology Co., Ltd.:

| Test                   | Range       | Measurement<br>Uncertainty | Notes |
|------------------------|-------------|----------------------------|-------|
| Radiated Emission      | 30~1000MHz  | 4.06 dB                    | (1)   |
| Radiated Emission      | 1~18GHz     | 5.14 dB                    | (1)   |
| Radiated Emission      | 18-40GHz    | 5.38 dB                    | (1)   |
| Conducted Disturbance  | 0.15~30MHz  | 2.14 dB                    | (1)   |
| Output Peak power      | 30MHz~18GHz | 0.55 dB                    | (1)   |
| Power spectral density |             | 0.57 dB                    | (1)   |
| Spectrum bandwidth     | /           | 1.1%                       | (1)   |

# TEST CONDITIONS AND RESULTS

#### 4.1 AC Power Conducted Emission

#### **TEST CONFIGURATION**

#### **TEST PROCEDURE**

- 1 The equipment was set up as per the test configuration to simulate typical actual usage per the user's manual. The EUT is a tabletop system, a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.10-2013.
- 2 Support equipment, if needed, was placed as per ANSI C63.10-2013
- 3 All I/O cables were positioned to simulate typical actual usage as per ANSI C63.10-2013
- 4 The EUT received power from adapter, the adapter received AC120V/60Hz and AC 240V/60Hz power through a Line Impedance Stabilization Network (LISN) which supplied power source and was grounded to the ground plane.
- 5 All support equipments received AC power from a second LISN, if any.
- 6 The EUT test program was started. Emissions were measured on each current carrying line of the EUT using a spectrum Analyzer / Receiver connected to the LISN powering the EUT. The LISN has two monitoring points: Line 1 (Hot Side) and Line 2 (Neutral Side). Two scans were taken: one with Line 1 connected to Analyzer / Receiver and Line 2 connected to a 50 ohm load; the second scan had Line 1 connected to a 50 ohm load and Line 2 connected to the Analyzer / Receiver.
- 7 Analyzer / Receiver scanned from 150 KHz to 30MHz for emissions in each of the test modes.
- 8 During the above scans, the emissions were maximized by cable manipulation.

#### **AC Power Conducted Emission Limit**

For intentional device, according to § 15.207(a) AC Power Conducted Emission Limits is as following:

| Fraguenay rango (MHz)                            | Limit (dBuV) |           |  |  |  |  |  |
|--|--------------|-----------|--|--|--|--|--|
| Frequency range (MHz)                            | Quasi-peak   | Average   |  |  |  |  |  |
| 0.15-0.5   | 66 to 56*    | 56 to 46* |  |  |  |  |  |
| 0.5-5  | 56           | 46        |  |  |  |  |  |
| 5-30   | 60           | 50        |  |  |  |  |  |
| * Decreases with the logarithm of the frequency. |              |           |  |  |  |  |  |

The EUT is powered by the Battery, so this test item is not applicable for the EUT.

Page 12 of 39 Report No.: CTA23111700201

#### 4.2 **Radiated Emission**

#### **TEST CONFIGURATION**

Frequency range 9 KHz - 30MHz

Frequency range 30MHz - 1000MHz

Frequency range above 1GHz-25GHz

Page 13 of 39 Report No.: CTA23111700201

#### TEST PROCEDURE

- 1. The EUT was placed on a turn table which is 0.8m above ground plane when testing frequency range 9 KHz -1GHz; the EUT was placed on a turn table which is 1.5m above ground plane when testing frequency range 1GHz - 25GHz.
- 2. Maximum procedure was performed by raising the receiving antenna from 1m to 4m and rotating the turn table from 0° to 360° to acquire the highest emissions from EUT.
- 3. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- Repeat above procedures until all frequency measurements have been completed.
- Radiated emission test frequency band from 9KHz to 25GHz. 5.
- The distance between test antenna and EUT as following table states:

| Test Frequency range | Test Antenna Type          | Test Distance | (C)     |
|----------------------|----------------------------|---------------|---------|
| 9KHz-30MHz           | Active Loop Antenna        | 3             | 75 00-2 |
| 30MHz-1GHz           | Ultra-Broadband Antenna    | 3             |         |
| 1GHz-18GHz           | Double Ridged Horn Antenna | 3             |         |
| 18GHz-25GHz          | Horn Anternna              | 1             |         |

Setting test receiver/spectrum as following table states:

| Test Frequency range | Test Receiver/Spectrum Setting         | Detector |
|----------------------|--|----------|
| 9KHz-150KHz          | RBW=200Hz/VBW=3KHz,Sweep time=Auto     | QP       |
| 150KHz-30MHz         | RBW=9KHz/VBW=100KHz,Sweep time=Auto    | QP       |
| 30MHz-1GHz           | RBW=120KHz/VBW=1000KHz,Sweep time=Auto | QP       |
|                      | Peak Value: RBW=1MHz/VBW=3MHz,         |          |
| 1GHz-40GHz           | Sweep time=Auto                        | Peak     |
| 1GH2-40GHZ           | Average Value: RBW=1MHz/VBW=10Hz,      | reak     |
|                      | Sweep time=Auto                        |          |

#### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor and subtracting the Amplifier Gain and Duty Cycle Correction Factor(if any) from the measured reading. The basic equation with a sample calculation is as follows:

#### FS = RA + AF + CL - AG

| sample calculation is as follows: | STING                                      |
|-----------------------------------|--|
| FS = RA + AF + CL - AG            | CTATES                                     |
| Where FS = Field Strength         | CL = Cable Attenuation Factor (Cable Loss) |
| RA = Reading Amplitude            | AG = Amplifier Gain                        |
| AF = Antenna Factor               | (CIP)                                      |

Transd=AF +CL-AG

#### RADIATION LIMIT

For intentional device, according to § 15.209(a), the general requirement of field strength of radiated emission from intentional radiators at a distance of 3 meters shall not exceed the following table. According to § 15.247(d), in any 100kHz bandwidth outside the frequency band in which the EUT is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20dB below that in the100kHz bandwidth within the band that contains the highest level of desired power.

The pre-test have done for the EUT in three axes and found the worst emission at position shown in test setup photos.

| Frequency (MHz) | Distance<br>(Meters) |                                  |              |  |  |
|-----------------|----------------------|----------------------------------|--------------|--|--|
| 0.009-0.49      | 3                    | 20log(2400/F(KHz))+40log(300/3)  | 2400/F(KHz)  |  |  |
| 0.49-1.705      | 3                    | 20log(24000/F(KHz))+ 40log(30/3) | 24000/F(KHz) |  |  |
| 1.705-30        | 3                    | 20log(30)+ 40log(30/3)           | 30           |  |  |
| 30-88           | 3                    | 40.0                             | 100          |  |  |
| 88-216          | 3                    | 43.5                             | 150          |  |  |
| 216-960         | 3                    | 46.0                             | 200          |  |  |
| Above 960       | 3                    | 54.0                             | 500          |  |  |

Page 14 of 39 Report No.: CTA23111700201

#### **TEST RESULTS**

#### Remark:

- This test was performed with EUT in X, Y, Z position and the worse case was found when EUT in X
- 2. For below 1GHz testing recorded worst at GFSK middle channel.
- 3. Radiated emission test from 9 KHz to 10th harmonic of fundamental was verified, and no emission found except system noise floor in 9 KHz to 30MHz and not recorded in this report.

#### 20dB Bandwidth

#### Limit

For frequency hopping systems operating in the 2400MHz-2483.5MHz no limit for 20dB bandwidth.

#### **Test Procedure**

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with 30 KHz RBW and 100 KHz VBW.

The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power minus 20dB.

#### **Test Configuration**

#### **Test Results**

#### **Frequency Separation**

#### LIMIT

According to 15.247(a)(1), frequency hopping systems shall have hopping channel carrier frequencies separated by minimum of 25KHz or the 2/3\*20dB bandwidth of the hopping channel, whichever is greater.

#### **TEST PROCEDURE**

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with 300 KHz RBW and 300 KHz VBW.

#### **TEST CONFIGURATION**

#### **TEST RESULTS**

| TEST RESULTS |         | CTATES                   |                   | TESTING |

#### Test plot as follows:

Report No.: CTA23111700201 Page 27 of 39

#### **Out-of-band Emissions** 4.8

#### Limit (

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF con-ducted or a radiated measurement, pro-vided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter com-plies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.

#### **Test Procedure**

Connect the transmitter output to spectrum analyzer using a low loss RF cable, and set the spectrum analyzer to RBW=100 kHz, VBW= 300 kHz, peak detector, and max hold. Measurements utilizing these setting are CTA TESTING made of the in-band reference level, bandedge and out-of-band emissions.

#### **Test Configuration**

#### **Test Results**

Remark: The measurement frequency range is from 30MHz to the 10th harmonic of the fundamental frequency. The lowest, middle and highest channels are tested to verify the spurious emissions and bandage measurement data.

Test plot as follows:

# **Pseudorandom Frequency Hopping Sequence**

#### TEST APPLICABLE

#### For 47 CFR Part 15C section 15.247 (a) (1) requirement:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hop-ping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hop-ping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

## **EUT Pseudorandom Frequency Hopping Sequence Requirement**

The pseudorandom frequency hopping sequence may be generated in a nice-stage shift register whose 5<sup>th</sup> and 9<sup>th</sup> stage outputs are added in a modulo-two addition stage. And the result is fed back to the input of the first stage. The sequence begins with the first one of 9 consecutive ones, for example: the shift register is initialized with nine ones.

- Number of shift register stages:9
- Length of pseudo-random sequence:29-1=511 bits
- Longest sequence of zeros:8(non-inverted signal)

Linear Feedback Shift Register for Generation of the PRBS sequence

An example of pseudorandom frequency hopping sequence as follows:

Each frequency used equally one the average by each transmitter.

The system receiver have input bandwidths that match the hopping channel bandwidths of their corresponding transmitter and shift frequencies in synchronization with the transmitted signals.

Page 32 of 39 Report No.: CTA23111700201

#### 4.10 Antenna Requirement

#### Standard Applicable

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

And according to FCC 47 CFR Section 15.247 (c), if transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi.

#### Refer to statement below for compliance

The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

#### **Antenna Connected Construction**

The maximum gain of antenna was -1.52 dBi.

Remark: The antenna gain is provided by the customer, if the data provided by the customer is not accurate, Shenzhen CTA Testing Technology Co., Ltd. does not assume any responsibility. CTATES
