

# Test report

REP026818-9TRFEMC

Date of issue: March 30, 2024

Applicant:

Murphy's Bowl LLC

Product:

Wireless Information Station

Model:

IDAP v1.0

Variant(s):

None

Specifications:

- ◆ 2D Antenna Pattern and Peak Gain

Lab and test locations

## Section 4 Engineering considerations

---

---

### 4.1 Modifications incorporated in the EUT

---

---

None.

### 4.2 Technical judgement

---

None.

### 4.3 Deviations from laboratory test procedures

---

---

None.

## Section 5 Test conditions

---

---

### 5.1 Atmospheric conditions

---

---

|                   |            |
|-------------------|------------|
| Temperature       | 15–30 °C   |
| Relative humidity | 20–75 %    |
| Air pressure      | 86–106 kPa |

---

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

### 5.2 Power supply range

---

---

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages  $\pm 5\%$ , for which the equipment was designed.

## Section 6 Measurement uncertainty

### 6.1 Uncertainty of measurement

Nemko USA Inc. has calculated measurement uncertainty and is documented in EMC/MUC/001 “Uncertainty in EMC measurements.” Measurement uncertainty was calculated using the methods described in CISPR 16-4-2 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4-2: Uncertainties, statistics, and limit modelling – Measurement instrumentation uncertainty. The expression of Uncertainty in EMC testing. Measurement uncertainty calculations assume a coverage factor of K=2 with 95% certainty.

**Table 6.1-1: Measurement uncertainty calculations**

| Measurement  |                   | $U_{cispr}$ dB | $U_{lab}$ dB |
|--|-------------------|----------------|--------------|
| Conducted disturbance at AC mains and other port power using a V-AMN | 9 kHz to 150 kHz  | 3.8            | 2.9          |
|  | 150 kHz to 30 MHz | 3.4            | 2.3          |
| Conducted disturbance at telecommunication port using AAN            | 150 kHz to 30 MHz | 5.0            | 4.3          |
| Conducted disturbance at telecommunication port using CVP            | 150 kHz to 30 MHz | 3.9            | 2.9          |
| Conducted disturbance at telecommunication port using CP             | 150 kHz to 30 MHz | 2.9            | 1.4          |
| Conducted disturbance at telecommunication port using CP and CVP     | 150 kHz to 30 MHz | 4.0            | 3.1          |
| Radiated disturbance (electric field strength in a SAC)              | 30 MHz to 1 GHz   | 6.3            | 5.5          |
| Radiated disturbance (electric field strength in a FAR)              | 1 GHz to 6 GHz    | 5.2            | 4.7          |
| Radiated disturbance (electric field strength in a FAR)              | 6 GHz to 18 GHz   | 5.5            | 5.0          |

- Notes: Compliance assessment:
- If  $U_{lab}$  is less than or equal to  $U_{cispr}$  then:
- compliance is deemed to occur if no measured disturbance level exceeds the disturbance limit;
  - non-compliance is deemed to occur if any measured disturbance level exceeds the disturbance limit
- If  $U_{lab}$  is greater than  $U_{cispr}$  then:
- compliance is deemed to occur if no measured disturbance level, increased by  $(U_{lab} - U_{cispr})$ , exceeds the disturbance limit;
  - non-compliance is deemed to occur if any measured disturbance level, increased by  $(U_{lab} - U_{cispr})$ , exceeds the disturbance limit

V-AMN: V type artificial mains network  
 AAN: Asymmetric artificial network  
 CP: Current probe  
 CVP: Capacitive voltage probe  
 SAC: Semi-anechoic chamber  
 FAR: Fully anechoic room

#### 7.1.3 Notes

None

#### 7.1.4 Setup details

Measurements were performed in a 3m semi-anechoic chamber and consisted of 2 steps.

##### Step 1: Reference Measurement:

A reference antenna is connected to an RF signal generator via a ferrite-loaded cable and 6 dB attenuator. The reference antenna is then placed at the center of the anechoic chamber turntable at a height of approximately 1.5 m. The RF signal generator is then configured to generate a 0 dB unmodulated signal at the frequency(-ies) under test. The polarization of the receive antenna is adjusted to match the polarization of the transmit antenna and the turntable angle and receive antenna height are adjusted to maximize the received signal level at the measurement receiver.

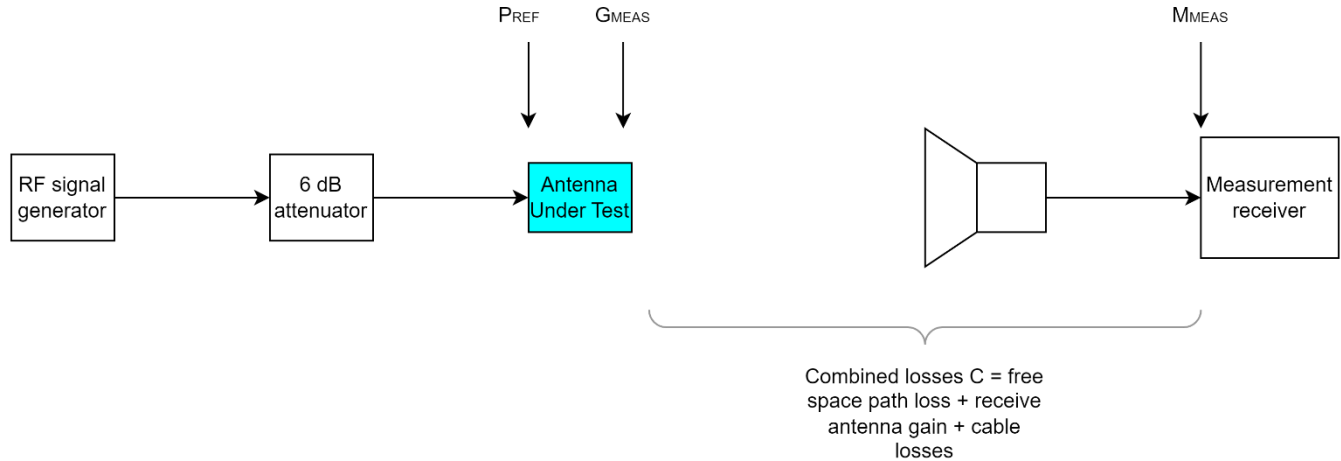

The signal level at the measurement receiver,  $M_{REF}$ , is recorded for each of the frequencies under test. Given that the transmit antenna is calibrated with a known gain  $G_{REF}$ , the following expression holds true:

$$M_{REF} = P_{REF} + G_{REF} + C \quad \text{Equation [1]}$$

### Step 2: Antenna Under Test Measurement

For this step, the reference antenna is replaced with the antenna under test. Again, the RF signal generator is set to 0 dBm output at the frequency(-ies) under test. The received signal level at the measurement receiver is recorded as the antenna under test is rotated 360 degrees in 5 degree steps. The receive antenna is then changed to the opposite polarization and the received signal level at the measurement receiver is recorded again as the turntable is rotated 360 degrees in 5 degree steps.

The peak received signal level at the measurement receiver is identified and noted as  $M_{MEAS}$ .

As before, the following holds true:

$$M_{MEAS} = P_{REF} + G_{MEAS} + C \quad \text{Equation [2]}$$

$G_{MEAS}$  is the peak gain of the antenna under test and is the value of interest.

Re-arranging Equation [2] in terms of  $G_{MEAS}$  gives:

$$G_{MEAS} = M_{MEAS} - P_{REF} - C \quad \text{Equation [3]}$$

And re-arranging Equation [1] in terms of  $P_{REF}$  gives:

$$P_{REF} = M_{REF} - G_{REF} - C \quad \text{Equation [4]}$$

Substituting  $P_{REF}$  in Equation [3] with Equation [4] gives:

$$\begin{aligned} G_{MEAS} &= M_{MEAS} - (M_{REF} - G_{REF} - C) - C \\ G_{MEAS} &= M_{MEAS} - M_{REF} + G_{REF} + C - C \end{aligned}$$

$$G_{MEAS} = M_{MEAS} - M_{REF} + G_{REF} \quad \text{Equation [5]}$$

Where:

- $G_{MEAS}$  = peak gain of antenna under test in dBi
- $M_{MEAS}$  = measured received signal level with antenna under test
- $M_{REF}$  = measured received signal level with calibrated reference antenna
- $G_{REF}$  = gain of reference antenna in dBi

Notes: None

**7.1.5 Test data**

**Table 7.1-3: 2D antenna pattern and peak gain results antenna port1**

| Frequency (MHz) | Peak Gain (dBi) |
|-----------------|-----------------|
| 2402 MHz        | -6.99           |
| 2440 MHz        | -3.53           |
| 2480 MHz        | -2.10           |

Sample calculation:

Frequency: 2402 MHz

M<sub>MEAS</sub>: -24.43 dBi

M<sub>REF</sub>: -18.74 dBi

G<sub>REF</sub>: 9.577 dBi

Note: The peak gain is in horizontal polarization

$$\begin{aligned}
 G_{MEAS} &= M_{MEAS} - M_{REF} + G_{REF} \\
 &= (-25.29) - (-24.43) + (9.577) \\
 &= -6.99 \text{ dBi}
 \end{aligned}$$
