2.3 Block Diagram of Test Setup

2.4 test standard

According to customer requirements.

2.5 Test Procedure

- (1) Set up the antenna to be measured. Set up the antenna and mark the cross reference line at the center of the antenna port surface to be measured.
- (2) Connect the reception antenna test port to the test equipment port
- (3) Open the test software, create the test project, and configure the test port.
- (4) Use test software for automatic testing and save test data of electromagnetic field distribution.
- (5) Change the port, down dip Angle, or test frequency (if necessary), and repeat steps (3) to (4) until all status data to be measured is collected.

2.6 Result

Frequency ID	Frequency (MHz)	Efficiency (dBi)	Efficiency (%)	Peak Gain (dBi)
1	433.0	-22.73	0.53	-13.51

3. Near-field pattern measurement

3.1 General Information

Test Date	2023-12-29

3.3 Block Diagram of Test Setup

3.4 test standard

According to customer requirements.

3.5 Test Procedure

- (1) Set up the antenna to be measured. Set up the antenna and mark the cross reference line at the center of the antenna port surface to be measured.
- (2) Connect the cable connector and adjust the down dip Angle (electrically tuned antenna).
- (3) Open the test software, create the test project, and configure the test port.
- (4) Use test software for automatic testing and save test data of electromagnetic field distribution.
- (5) Change the port, down dip Angle, or test frequency (if necessary), and repeat steps (3) to (4) until all status data to be measured is collected.

(6) After near and far field exchange, the three-position spherical pattern of the antenna to be tested is obtained, and the Theta and Phi angles of the position where the maximum level of the three-position spherical pattern is located are found. The horizontal plane pattern curve of the antenna to be tested is obtained by cutting according to equal Theta Angle, and the vertical plane pattern of the antenna to be tested is cancelled by cutting according to equal Phi Angle. Then the radiation parameters of the horizontal plane and vertical plane pattern of the antenna to be measured are obtained by using the processing method similar to that of the far field.
