3. RF Exposure

3.1 Standard Applicable

According to § 1.1307, the portable transmitter must comply the RF exposure requirements.

3.2 Test Result

This product complied with the requirement of the RF exposure, please see the MPE report.

4. RF Output Power

4.1 Standard Applicable

According to § 90.1321 Base and fixed stations are limited to 25 watts/25 MHz equivalent isotropically radiated power (EIRP). In any event, the peak EIRP power density shall not exceed 1 Watt in any one-megahertz slice of spectrum.

4.2 Test Procedure

Conducted output power test method:

Radiated power test method:

1. The setup of EUT is according with per KDB 971168 D01 v02r02 measurement procedure.
2. The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.
3. The frequency range up to tenth harmonic of the fundamental frequency was investigated.
4. Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

8. Band edge

8.1 Standard Applicable

According to §90.1323 (a) The power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or less, but at least one percent of the emission bandwidth of the fundamental emission of the transmitter, provided the measured energy is integrated over a 1 MHz bandwidth.

Temperature:	20°C
Relative Humidity:	54%

10. Contention-based protocol

10.1 Standard Applicable

A protocol that allows multiple users to share the same spectrum by defining the events that must occur when two or more transmitters attempt to simultaneously access the same channel and establishing rules by which a transmitter provides reasonable opportunities for other transmitters to operate. Such a protocol may consist of procedures for initiating new transmissions, procedures for determining the state of the channel (available or unavailable), and procedures for managing retransmissions in the event of a busy channel.

10.2 Test Procedure

All tests were performed as conducted measurements; the antenna ports gave independent access to horizontal and vertical antenna connections.

- 1) Power on EUT, set LBT state including Channel on Threshold level and Channel off Threshold level (these two levels can be configured by operator)
- 2) Adjust output power of signal generator to act as an interference at the antenna port
- 3) Monitor EUT state on the control computer

10.3 Test Results

Pi: interference power level

P1: channel off threshold power level

P2: channel on threshold power level

DL: down link

Concurrent: clock alignment between interference signal and wanted signal

Non-concurrent: no clock alignment between interference signal and wanted signal

Note: CW signal was used as interference for unlike systems; Interference power level at antenna port can be detected by EUT and observed on the control computer.
