

TEST REPORT

of

FCC Part 15 Subpart F §15.503, §15.519 and §15.521

FCC ID: A3LEIT5600

Equipment Under Test : Galaxy Smart Tag2
Model Name : EI-T5600
Variant Model Name(s) : -
Applicant : Samsung Electronics Co Ltd
Manufacturer : Samsung Electronics Co., Ltd.
Date of Receipt : 2024.01.17
Date of Test(s) : 2024.01.17 ~ 2023.02.13
Date of Issue : 2023.02.14

In the configuration tested, the EUT complied with the standards specified above. This test report does not assure KOLAS accreditation.

- 1) The results of this test report are effective only to the items tested.
- 2) The SGS Korea is not responsible for the sampling, the results of this test report apply to the sample as received.
- 3) This test report cannot be reproduced, except in full, without prior written permission of the Company.
- 4) The data marked ※ in this report was provided by the customer and may affect the validity of the test results.

We are responsible for all the information of this test report except for the data(※) provided by the customer

1. General Information

1.1. Testing Laboratory

SGS Korea Co., Ltd. (Gunpo Laboratory)

- 10-2, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807
- 4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807
- Designation number: KR0150

All SGS services are rendered in accordance with the applicable SGS conditions of service available on request and accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>.

Telephone : +82 31 688 0901

FAX : +82 31 688 0921

1.2. Details of Applicant

Applicant : Samsung Electronics Co Ltd

Address : 19 Chapin Rd., Building D, Pine Brook, New Jersey, United States, 07058

Contact Person : Chun, Jenni

Phone No. : +1 973 808 6375

1.3. Details of Manufacturer

Company : Samsung Electronics Co., Ltd.

Address : 129, Samsung-ro, Yeongtong-gu, Suwon-si, Gyeonggi-do, 16677, Republic of Korea

1.4. Description of EUT

Kind of Product	Galaxy Smart Tag2
Model Name	EI-T5600
Serial Number	EI-T5600_003
Power Supply	DC 3.0 V
Frequency Range	Tx: 7 987.2 MHz, Rx: 7 987.2 MHz
Modulation Type	BPM-BPSK
Number of Channel	1
Antenna Type	LDS antenna
Antenna Gain*	0.33 dBi
H/W Version	2.0
S/W Version	2.0

1.5. Test Equipment List

Note;

- For equipment listed above that has a calibration date or calibration due date that falls within the test date range, care was taken to ensure that this equipment was used after the calibration date and before the calibration due date.

1.6. Summary of Test Results

The EUT has been tested according to the following specifications:

APPLIED STANDARD: FCC Part15 subpart F		
Section	Test Item(s)	Result
15.519(c) 15.519(e) 15.521(g)	Maximum Peak Power and Average Emissions	Complied
15.209(a) 15.505(b) 15.519(c) 15.519(d) 15.521(a) 15.521(c) 15.521(h)	Radiated emissions	Complied
15.503(a) 15.519(b) 15.521(e)	10 dB Bandwidth	Complied
15.519(a)(1)	Cease Transmission Time	Complied
15.207	AC Conducted Emissions	N/A ¹⁾

Note;

- 1) The AC power line test was not performed because the EUT use battery power for operation and which do not operate from the AC power lines.
- 2) Handheld UWB devices operating under the provisions of this section may operate indoor or outdoors.

1.7. Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

Parameter	Uncertainty	
10 dB Bandwidth	0.98 MHz	
Cease Transmission Time	1.65 ms	
Radiated Emission, 9 kHz to 30 MHz	H	3.60 dB
	V	3.60 dB
Radiated Emission, below 1 GHz	H	4.60 dB
	V	4.90 dB
Radiated Emission, above 1 GHz	H	3.90 dB
	V	3.80 dB

All measurement uncertainty values are shown with a coverage factor of $k=2$ to indicate a 95 % level of confidence.

1.8. Test Report Revision

Revision	Report Number	Date of Issue	Description
0	F690501-RF-RTL004822	2024.02.14	Initial

1.9. Information of software for test

- Using the software of SerComK tool(V2.02) to testing of EUT.

2. Maximum Peak Power and Radiated Emissions

2.1. Test Setup

The diagram below shows the test setup that is utilized to make the measurements for emission below 30 MHz.

The diagram below shows the test setup that is utilized to make the measurements for emission from 30 MHz to 1 GHz.

The diagram below shows the test setup that is utilized to make the measurements for emission. The spurious emissions were investigated from 1 GHz to the 10th harmonic of the highest fundamental frequency or 40 GHz, whichever is lower.

2.2. Limit

2.2.1. Maximum Peak Power

According to §15.519(e), there is a limit on the peak level of the emissions contained within a 50 MHz bandwidth centered on the frequency at which the highest radiated emission occurs, f_m . That limit is 0 dBm EIRP. It is acceptable to employ a different resolution bandwidth, and a correspondingly different peak emission limit, following the procedures described in §15.521.

2.2.2. Radiated Emissions at or below 960 MHz

According to §15.519(c), the radiated emissions at or below 960 MHz from a device operating under the provisions of this section shall not exceed the emission levels in §15.209.

According to §15.521(c), Emissions from digital circuitry used to enable the operation of the UWB transmitter shall comply with the limits in § 15.209, rather than the limits specified in this subpart, provided it can be clearly demonstrated that those emissions from the UWB device are due solely to emissions from digital circuitry contained within the transmitter and that the emissions are not intended to be radiated from the transmitter's antenna. Emissions from associated digital devices, as defined in § 15.3(k), e.g., emissions from digital circuitry used to control additional functions or capabilities other than the UWB transmission, are subject to the limits contained in Subpart B of this part.

According to §15.209(a), except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meter)
0.009-0.490	2 400/F(kHz)	300
0.490-1.705	24 000/F(kHz)	30
1.705-30.0	30	30
30-88	100**	3
88-216	150**	3
216-960	200**	3
Above 960	500	3

** Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this part, e.g., §§15.231 and 15.241.

2.2.3. Radiated Emissions above 960 MHz

According to §15.519(c), the radiated emissions above 960 MHz from a device operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of 1 MHz:

Frequency in MHz	EIRP in dB m
960-1 610	-75.3
1 610-1 990	-63.3
1 990-3 100	-61.3
3 100-10 600	-41.3
Above 10 600	-61.3

According to §15.519(d), in addition to the radiated emission limits specified in the table in paragraph (c) of this section, UWB transmitters operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of no less than 1 kHz:

Frequency in MHz	EIRP in dB m
1 164-1 240	-85.3
1 559-1 610	-85.3

According to §15.521(h), The highest frequency employed in § 15.33 to determine the frequency range over which radiated measurements are made shall be based on the center frequency, f_c , unless a higher frequency is generated within the UWB device. For measuring emission levels, the spectrum shall be investigated from the lowest frequency generated in the UWB transmitter, without going below 9 kHz, up to the frequency range shown in § 15.33(a) or up to $f_c + 3/(\text{pulse width in seconds})$, whichever is higher. There is no requirement to measure emissions beyond 40 GHz provided f_c is less than 10 GHz; beyond 100 GHz if f_c is at or above 10 GHz and below 30 GHz; or beyond 200 GHz if f_c is at or above 30 GHz.

2.3. Test Procedures

Radiated emissions from the EUT were measured according to the dictates of ANSI C63.10-2013.

2.3.1. Test Procedures for emission below 30 MHz

- The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- Then antenna is a loop antenna is fixed at one meter above the ground to determine the maximum value of the field strength. Both parallel and perpendicular of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

2.3.2. Test Procedures for emission from 30 MHz to 1 000 MHz

- The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- During performing radiated emission below 1 GHz, the EUT was set 3 meters away from the interference receiving antenna, which was mounted on the top of a variable-height antenna tower. During performing radiated emission above 1 GHz, the EUT was set 3 meter away from the interference-receiving antenna.
- The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.

2.3.3. Test Procedures for emission above 1 GHz

- The EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- The EUT was set 0.5 and 1 meters away from the interference receiving antenna, which was mounted on the top of a variable-height antenna tower.
- The antenna is a horn antenna and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.

1. Peak power Measurement

- The Peak power measurement refer to section 10.3.5 and 10.3.6

The RBW = less than 50 MHz (but no less than 1 MHz), VBW is set to at least 1 MHz (3 MHz is recommended),

When this approach is employed, the peak emissions EIRP limit (0 dBm / 50 MHz) is converted to a limit commensurate with the RBW by employing a $[20 \log (RBW / 50 \text{ MHz})]$ relationship.

When a resolution bandwidth of less than 50 MHz is used, this measurement shall be performed over a 50 MHz span centered on the frequency associated with the highest detected average emission level.

2. Average Measurement

- The Average Measurement refer to section 10.3.7

Set the RBW to 1 MHz (1 kHz for emission in the GPS bands), VBW to be at least 1 MHz (3 kHz for emission in the GPS bands), Detector = RMS, Sweep time = no more than a 1 ms integration period over each measurement bin.

2.4. Test Result

Ambient temperature : (23 ± 1) °C
 Relative humidity : 47 % R.H.

2.4.1. Maximum peak power and Average emission

All emissions tested both horizontal and vertical. The following table shows the highest levels of radiated emissions on the worst polarization.

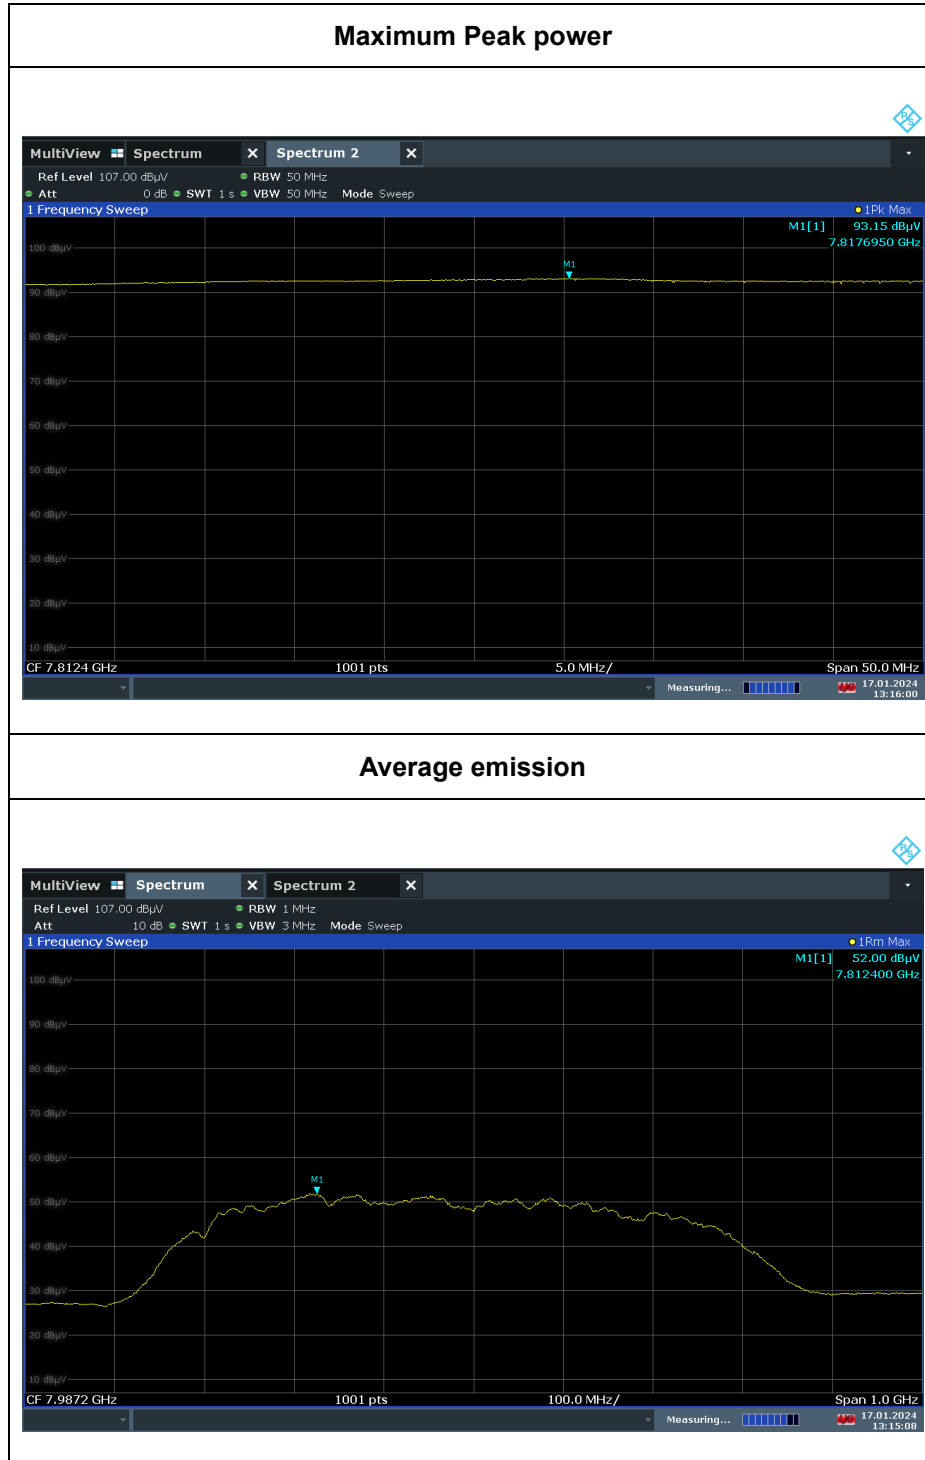

Frequency (MHz)	Reading (dBμV)	Ant. Pol.	Detect Mode	AF (dB/m)	AMP+CL (dB)	E (dBμV/m)	CF (dB)	E.I.R.P. (dB m)	Limit (dB m)	Margin (dB)

Remark;

1. E (dB μ V/m) = Reading (dB μ V) + Antenna Factor (dB/m) + Amp (dB) + Cable Loss (dB).
2. E.I.R.P. (dB m) = E (dB μ V/m) + 20 log D – 104.8; where D is the measurement distance in meters.
3. CF (dB) (E.I.R.P.) = 20 log D – 104.8;
4. All the emissions were measured at a 1 meter test distance.
5. AF = Antenna Factor, AMP = Amplifier, CL = Cable Loss.

384.01	35.10	Peak	V	20.90	-25.66	30.34	46.00	15.66
Above 400.00	Not detected	-	-	-	-	-	-	-

Remark;

1. Test from 30 MHz to 960 MHz was performed using the software of EP5RE(V5.3.70) from TOYO.
2. Reported spurious emissions are measured in worst case among configurations.
3. Radiated spurious emission measurement as below.
(Actual = Reading + AF + AMP + CL)
4. According to §15.31(o), emission levels are not report much lower than the limits by over 20 dB.

- Test plot

2.4.3. Radiated Spurious Emission above 960 MHz

All emissions tested both horizontal and vertical. The following table shows the highest levels of radiated emissions on the worst polarization.

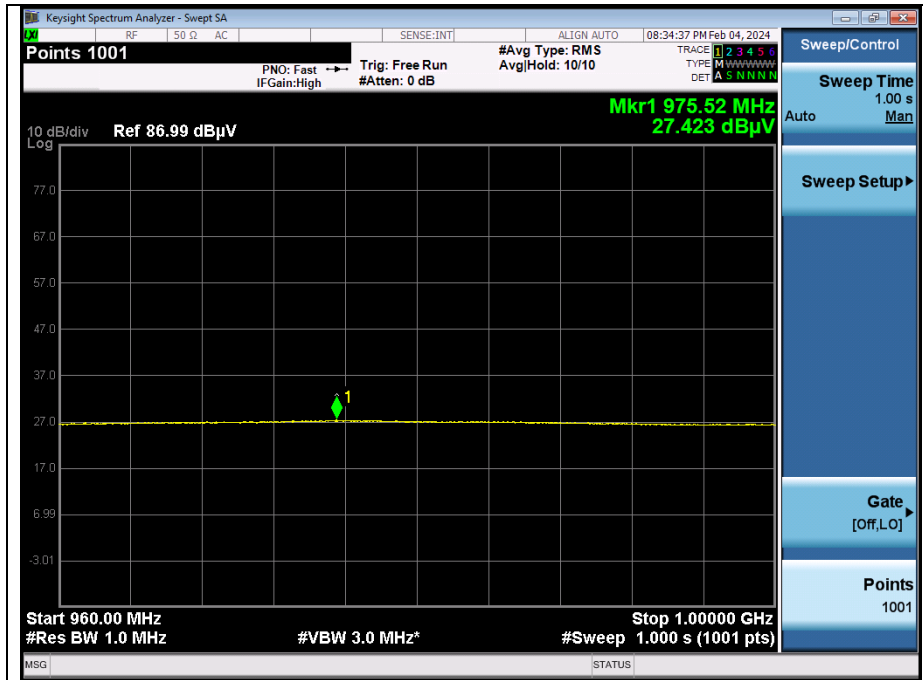

Frequency (MHz)	Reading (dB μ V*)	Ant. Pol.	AF (dB/m)	AMP+CL (dB)	E (dB μ V/m)	CF (dB)	E.I.R.P. (dB m)	Limit (dB m)	Margin (dB)

Remark;

1. E (dB μ V/m) = Reading (dB μ V) + Antenna Factor (dB/m) + Amp (dB) + Cable Loss (dB).
2. E.I.R.P. (dB m) = E (dB μ V/m) + 20 log D - 104.8; where D is the measurement distance in meters.
3. CF (dB) (E.I.R.P.) = 20 log D - 104.8
4. All the emissions above 960 MHz were measured at a 0.5 meter test distance.
5. Reported spurious emissions are measured in worst case among configurations.
6. "*" means the GPS band.
7. Measurement In frequency 1 164-1 240 MHz and 1 559-1 610 MHz, RBW is set to 1 kHz.
8. According to § 15.31(o), Emission levels are not reported much lower than the limits by over 20 dB.
9. AF = Antenna Factor, AMP = Amplifier, CL = Cable Loss.

3. 10 dB Bandwidth

3.1. Test Setup

3.2. Limit

According to §15.503(a), for the purpose of this subpart, the UWB bandwidth is the frequency band bounded by the points that are 10 dB below the highest radiated emission, as based on the complete transmission system including the antenna.

According to §15.519(b), the UWB bandwidth of a device operating under the provisions of this section must be contained between 3 100 MHz and 10,600 MHz.

According to §15.521(e), The frequency at which the highest radiated emission occurs, f_M , must be contained within the UWB bandwidth.

3.3. Test Procedure

10 dB Bandwidth

The test follows section 10.1 of ANSI C63.10-2013.

The frequency at which the maximum power level is measured with the peak detector is designated f_M . The peak power measurements shall be made using a spectrum analyzer or EMI receiver with a 1 MHz resolution bandwidth and a video bandwidth of 1 MHz or greater. The instrument shall be set to peak detection using the maximum-hold trace mode. The outermost 1 MHz segments above and below f_M , where the peak power falls by 10 dB relative to the level at f_M , are designated as f_H and f_L , respectively:

- a) For the lowest frequency bound f_L , the emission is searched from a frequency lower than f_M that has, by inspection, a peak power much lower than 10 dB less than the power at f_M and increased toward f_M until the peak power indicates 10 dB less than the power at f_M . The frequency of that segment is recorded.
- b) This process is repeated for the highest frequency bound f_H , beginning at a frequency higher than f_M that has, by inspection, a peak power much lower than 10 dB below the power at f_M . The frequency of that segment is recorded.
- c) The two recorded frequencies represent the highest f_H and lowest f_L bounds of the UWB transmission, and the -10 dB bandwidth ($B - 10$) is defined as $(f_H - f_L)$. The center frequency (f_c) is mathematically determined from $(f_H + f_L) / 2$.

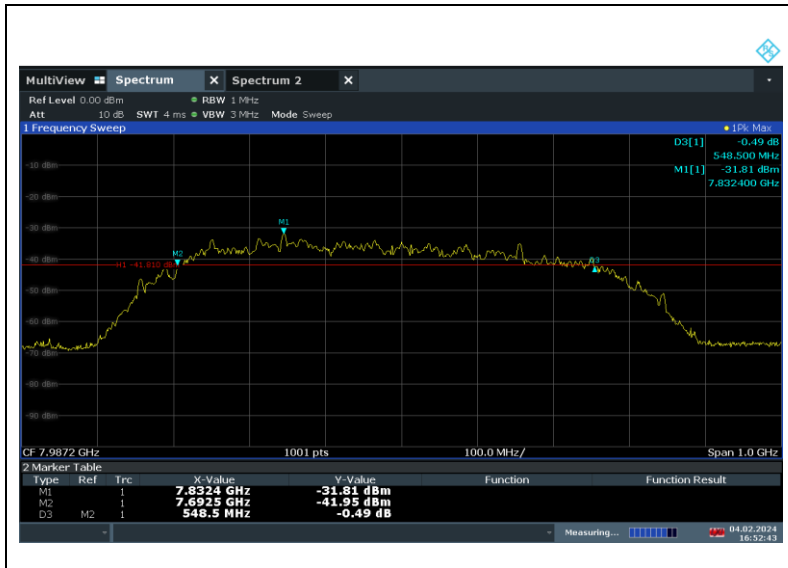

3.4. Test Result

Ambient temperature : (23 ± 1) °C
 Relative humidity : 47 % R.H.

4. Cease Transmission Time

4.1. Test Setup

4.2. Limit

According to §15.519(a)(1), a UWB device operating under the provisions of this section shall transmit only when it is sending information to an associated receiver. The UWB intentional radiator shall cease transmission within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB intentional radiator at least every 10 seconds or the UWB device must cease transmitting.

4.3. Test Procedure

1. The transmitter output is connected to the spectrum analyzer.
2. The bandwidth of the fundamental frequency was measured with the spectrum analyzer using RBW = 1 MHz, VBW = 3 MHz, Span = 0 Hz.

4.4. Test Result

Ambient temperature : (23 ± 1) °C
 Relative humidity : 47 % R.H.

Frequency (MHz)	Limit (sec)	Remark
7 987.20	10	Pass

- Test plot

Remark;

Marker 1 : EUT and smart phone are linked.
 Marker 2 : EUT ends UWB link.
 Marker 2Δ3 : 10s after EUT ends UWB link.

5. Antenna Requirement

5.1. Standard Applicable

For intentional device, according to FCC 47 CFR Section §15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. And according to FCC 47 CFR Section §15.519 (a)(2), the use of antennas mounted on outdoor structures, e.g., antenna mounted on the outside of a building or on a telephone pole, or any fixed outdoors infrastructure is prohibited. Antennas may be mounted only on the hand held UWB device.

5.2. Antenna Connected Construction

Antenna used in this product is LDS antenna with gain of 0.33 dBi.
