# Appendix A. Test Sequences and Test setup photo

- 1. Test sequence is generated based on below parameters of the EUT:
  - a. Measured maximum power (Pmax)
  - b. Measured Tx\_power\_at\_SAR\_design\_target (Plimit)
  - c. Reserve\_power\_margin (dB)

Preserve (dBm) = measured Plimit(dBm) - Reserve\_power\_margin (dB)

d. SAR\_time\_window (100s for FCC)

## 2. Test Sequence 1 Waveform:

Based on the parameters above, the Test Sequence 1 is generated with one transition between high and low Tx powers. Here, high power =  $P_{max}$ ; low power =  $P_{max}/2$ , and the transition occurs after 80 seconds at high power  $P_{max}$ . As long as the power enforcement is taking into effective during one 100s/60s time window, the validation test with this defined test sequence 1 is valid, otherwise, select other radio configuration (band/DSI within the same technology group) having lower  $P_{limit}$  for this test. The Test sequence 1 waveform is shown below:

### 3. Test Sequence 2 Waveform:

Based on the parameters in A-1, the Test Sequence 2 is generated as described in Table A-1, which contains two 170 second-long sequences (yellow and green highlighted rows) that are mirrored around the center row of 20s, resulting in a total duration of 360 seconds:

Time duration (seconds)	dB relative to Plimit or Preserve
15	Preserve — 2
20	Plimit
20	(Plimit + Pmax)/2 averaged in mW and rounded to nearest 0.1 dB step
10	Preserve — 6
