### 8.4 Peak To Average Ratio

## Test Overview

The peak to average ratio measurement is performed at the conducted port of the EUT. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) measurement profile is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth. The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The percent of time the signal spends at or above the level defines the probability for that particular power level.

## Test Procedure Used

KDB 971168 D01 v03r01 - Section 5.7
ANSI C63.26-2015 - Section 5.2.3.4

## Test Setting

The measurement was made using a direct connection between the RF output of the EUT and the spectrum analyzer. The spectrum analyzer setting were as follows:

1. The signal analyzer's CCDF function is enabled.
2. Frequency = carrier center frequency
3. Measurement BW $\geq$ OBW or specified reference bandwidth
4. The signal analyzer was set to collect one million samples to generate the CCDF curve
5. The measurement interval was set depending on the type of signal analyzed. For continuous signals ( $>98 \%$ duty cycle), the measurement interval was set to 1 ms .

## Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 8-4. Test Instrument \& Measurement Setup

## Limit

The peak-to-average power ratio (PAPR) limit shall not exceed 13 dB for more than $0.1 \%$ of the time.

### 8.5 Band Edge Emissions at Antenna Terminal

## Test Overview

All out of band emissions are measured with a spectrum analyzer connected to the antenna terminal of the EUT while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies. All data rates were investigated to determine the worst case configuration. All modes of operation were investigated and the worst case configuration results are reported in this section.

## Test Procedure Used

KDB 971168 D01 v03r01 - Section 6
KDB 662911 D01 v02r01 - Section E)3) Out-of-Band and Spurious Emission Measurements
a) Absolute Emission Limits
iii) Measure and add $10 \log \left(\mathrm{~N}_{\text {ant }}\right) \mathrm{dB}$

ANSI C63.26-2015 - Section 5.7.3

## Test Setting

1. Start and stop frequency were set such that the band edge would be placed in the center of the plot
2. Span was set large enough so as to capture all out of band emissions near the band edge
3. RBW: Please see test notes below.
4. VBW $\geq 3 \times$ RBW
5. $\quad$ Detector $=\mathrm{RMS}$
6. Number of sweep points $\geq 2 \times$ Span/RBW
7. Trace mode $=$ trace average
8. Sweep time = auto couple
9. The trace was allowed to stabilize

## Limit

The minimum permissible attenuation level of any spurious emission is $43+\log _{10}\left(\mathrm{P}_{[\text {watts }}\right)$, where P is the transmitter power in Watts.
The power of any emission outside of the authorized operating frequency range cannot exeed -13 dBm .

## Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 8-5. Test Instrument \& Measurement Setup

## Test Notes

1. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 1 megahertz or greater. However, in the 1 megahertz bands immediately outside and adjacent to the licensee's frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
2. All the measurement has been tested but test plots are referred from the highest of value of each of modulation of each antenna ports.
3. When the channel edge detect with a margin of under 1 dB to Limit, That used to integration method was performed using the spectrum analyzer's band power functions according to ANSI C63.26-2015 - Section 5.7. The spectrum analyzer marker was placed at one-half of the RBW away from the band edge. The integration value was set to a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter.
4. The limits were adjusted by a factor of $\left[-10^{*} \log (4)\right] d B$ to account for the device operation as a 4 port MIMO transmitter, as per FCC KDB 622911. MIMO Factor calculation as below:
MIMO Factor $=10^{*} \log (4)=6.02 \mathrm{~dB}$

| Frequency range | Basic Limit <br> $(\mathbf{d B m} / \mathbf{M H z})$ | MIMO Factor <br> $(\mathbf{d B})$ | RBW Factor <br> $(\mathbf{d B})$ | Adjusted limit <br> $(\mathbf{d B m})$ |
| :---: | :---: | :---: | :---: | :---: |
| Low Frequency block -2 MHz | -13 | 6.02 | 0 | -19.02 |
| High Frequency block +2 MHz | -13 | 6.02 | 0 | -19.02 |

Note: Adjusted limit $(\mathrm{dBm} / \mathrm{MHz})=$ Basic limit $(\mathrm{dBm} / 1 \mathrm{MHz})-\mathrm{MIMO}$ Factor - RBW Factor
