### 2.2 Test Configuration

The setup is as follows:
a) The EUT ("RRU(RF4437d)") and a Data Unit (DU) are each powered by -48V DC power supply.
b) The DU is connected to a test laptop via an ethernet cable acting as backhaul.
c) DU connects to the EUT through a fiber optic cable.
d) An RF cable connects the signal analyzer and the EUT Ports for respective measurement.

The EUT was tested per the guidance of ANSI C63.26-2015 and KDB 971168 D01 v03r01. See Section 7.0 of this test report for a description of the radiated and antenna port conducted emissions tests..

### 4.0 MEASUREMENT UNCERTAINTY

The measurement uncertainties shown below were calculated in accordance with the requirements of ANSI C63.4-2014. All measurement uncertainty values are shown with a coverage factor of $k=2$ to indicate a 95\% level of confidence. The measurement uncertainty shown below meets or exceeds the UCISPR measurement uncertainty values specified in CISPR 16-4-2 and, thus, can be compared directly to specified limits to determine compliance.

Table 7-1. Summary of Test Results

## Notes:

1) All modes of operation and data rates were investigated. The test results shown in the following sections represent the worst case emissions.
2) The correction table was used to account for the losses of the cables and attenuators used to test the EUT at all frequencies of interest.
3) The analyzer plots were all taken with a correction table loaded into the analyzer.
4) All antenna port conducted emissions testing was performed on a test bench with the antenna port of the EUT connected to the spectrum analyzer through calibrated cables and attenuators.
5) This unit was tested while powered by a 48V DC power source.

### 7.2 Occupied Bandwidth

§ 2.1049

## Test Overview

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured. All modes of operation were investigated and the worst case configuration results are reported in this section.

## Test Procedures Used

KDB 971168 D01 v03r01 - Section 4.2, Section 4.3
ANSI C63.26-2015 - Section 5.4.3, Section 5.4.4

## Test Setting

The measurement was made using a direct connection between the RF output of the EUT and the spectrum analyzer. The spectrum analyzer setting were as follows:

1. The signal analyzer's automatic bandwidth measurement capability was used to perform the $99 \%$ occupied bandwidth and the 26 dB bandwidth. The bandwidth measurement was not influenced by any intermediate power nulls in the fundamental emission.
2. RBW $=1-5 \%$ of the expected OBW
3. VBW $\geq 3 \times$ RBW
4. Detector $=$ Peak
5. Trace mode $=$ max hold
6. Sweep = auto couple
7. The trace was allowed to stabilize
8. If necessary, steps $2-7$ were repeated after changing the RBW such that it would be within $1-5 \%$ of the $99 \%$ occupied bandwidth observed in Step 7

## Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-1. Test Instrument \& Measurement Setup

## Limit

The occupied bandwidth shall not exceed the equipment's channel bandwidth, which is declared by the manufacturer.
