| Applicant Name | SAMSUNG ELECTRONICS CO.,LTD. |
| FCC ID | A3LSMA236V |
| Model Number | SM-A236V |
| Applicable Standards | FCC 47 CFR § 2.1093 IEEE Std 1528-2013 Published RF exposure KDB procedures |
| Report type | Part.0 : SAR Characterization |
| Date Tested | 9/21/2022 to 11/11/2022 |
| Part 0 Purpose | Part 0 is the procedures for determining P_{Limit} for 2G/3G/4G/5G NR sub6 to satisfy SAR_design_target in order to FCC limit's requirement. |

UL Korea, Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Korea, Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Korea, Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Korea, Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by IAS, any agency of the Federal Government, or any agency of any government

2. Introduction

The equipment under test (EUT) is SAMSUNG Smartphone (FCC ID : A3LSMA236U), it contains the Qualcomm modems supporting 2G/3G/4G/5G NR technologies. These modems are enable with Qualcomm Smart Transmit feature to control and manage transmitting power in real time and to ensure at all times the time-averaged RF exposure is in compliance with FCC requirement.

This purpose of the part 0 report is to determine SAR char is derived from SAR test measurements and conducted power measurements to determine P_{Limit} for each technology/band. The P_{Limit} represents the maximum time-averaged power level for the corresponding radio/antenna configuration.

3. Facilities and Accreditation

The test sites and measurement facilities used to collect data are located at

| Suwon | |

UL Korea, Ltd. is accredited by IAS, Laboratory Code TL-637.

The full scope of accreditation can be viewed at <https://www.iasonline.org/wp-content/uploads/2017/05/TL-637-cert-New.pdf>.

4. SAR Measurement System & Test Equipment

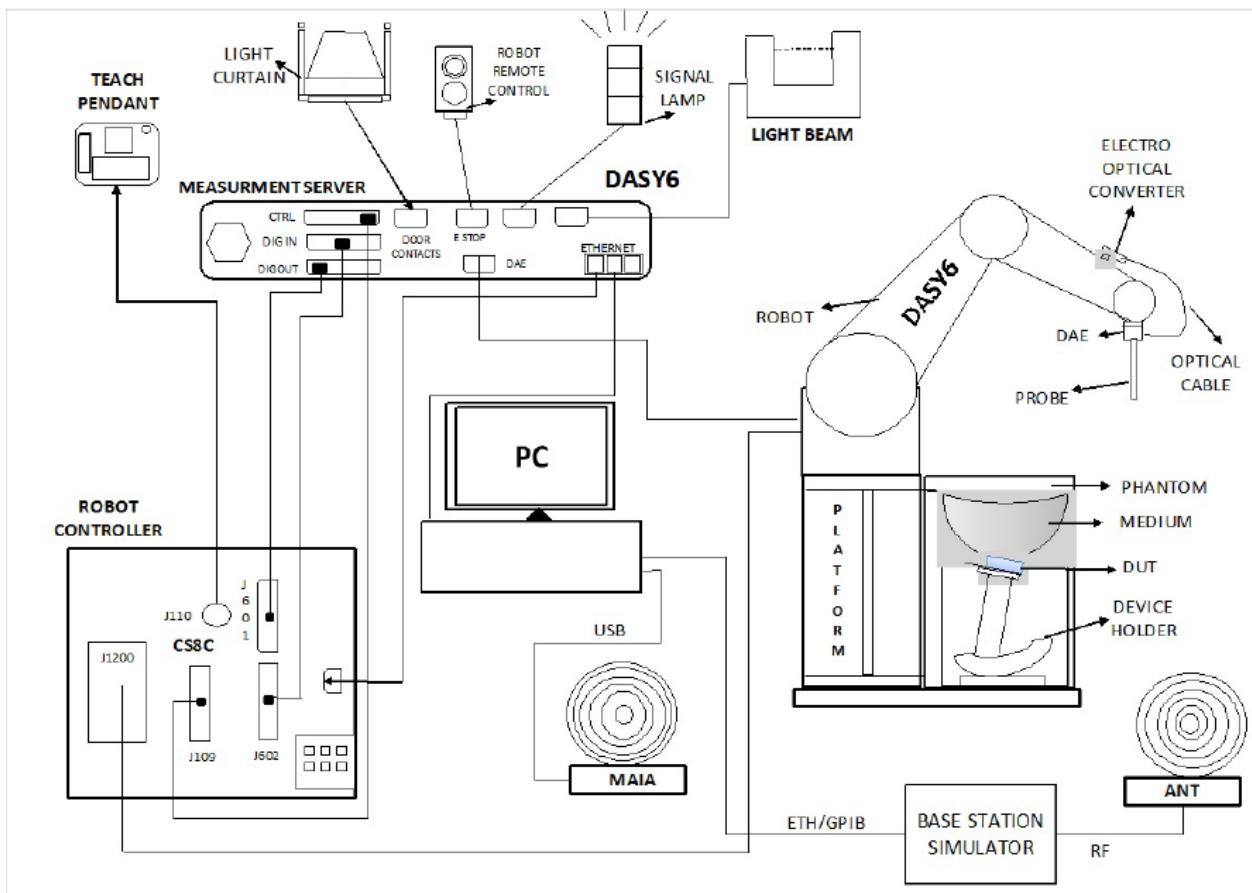

4.1. SAR Measurement System

The DASY5 system used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running WinXP or Win7 and the DASY5 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

The DASY6 & 8 system used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running Win10 and the DASY6 or 8 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

4.2. SAR Scan Procedures

Step 1: Power Reference Measurement

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 2.1 mm. This distance cannot be smaller than the distance of sensor calibration points to probe tip as defined in the probe properties.

Step 2: Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine measurement around the hot spot. The sophisticated interpolation routines implemented in DASY software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2 dB range is required in IEEE Standard 1528 and IEC 62209 standards, whereby 3 dB is a requirement when compliance is assessed in accordance with the ARIB standard (Japan). If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Area Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

| | ≤ 3 GHz | > 3 GHz |
|--|--|--|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | 5 ± 1 mm | $\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5$ mm |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location | $30^\circ \pm 1^\circ$ | $20^\circ \pm 1^\circ$ |
| | ≤ 2 GHz: ≤ 15 mm $2 - 3$ GHz: ≤ 12 mm | $3 - 4$ GHz: ≤ 12 mm $4 - 6$ GHz: ≤ 10 mm |
| Maximum area scan spatial resolution: $\Delta x_{\text{Area}}, \Delta y_{\text{Area}}$ | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be \leq the corresponding x or y dimension of the test device with at least one measurement point on the test device. | |

Step 3: Zoom Scan

Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The Zoom Scan measures points (refer to table below) within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1 g and 10 g and displays these values next to the job's label.

Zoom Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

| | | ≤ 3 GHz | > 3 GHz |
|---|---|--|---|
| Maximum zoom scan spatial resolution: Δx_{Zoom} , Δy_{Zoom} | | ≤ 2 GHz: ≤ 8 mm $2 - 3$ GHz: ≤ 5 mm* | $3 - 4$ GHz: ≤ 5 mm* $4 - 6$ GHz: ≤ 4 mm* |
| Maximum zoom scan spatial resolution, normal to phantom surface | uniform grid: $\Delta z_{Zoom}(n)$ graded grid | ≤ 5 mm | $3 - 4$ GHz: ≤ 4 mm $4 - 5$ GHz: ≤ 3 mm $5 - 6$ GHz: ≤ 2 mm |
| | | ≤ 4 mm | $3 - 4$ GHz: ≤ 3 mm $4 - 5$ GHz: ≤ 2.5 mm $5 - 6$ GHz: ≤ 2 mm |
| Minimum zoom scan volume | x, y, z | ≥ 30 mm | $3 - 4$ GHz: ≥ 28 mm $4 - 5$ GHz: ≥ 25 mm $5 - 6$ GHz: ≥ 22 mm |

Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

* When zoom scan is required and the *reported* SAR from the *area scan based 1-g SAR estimation* procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

Step 4: Power drift measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Step 5: Z-Scan (FCC only)

The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a one-dimensional grid. In order to get a reasonable extrapolation the extrapolated distance should not be larger than the step size in Z-direction.

4.3. Test Equipment

The measuring equipment used to perform the tests documented in this report has been calibrated in accordance with the manufacturers' recommendations, and is traceable to recognized national standards.

5. Device Under Test (DUT) Information

5.1. Wireless Technologies

| Wireless technologies | Frequency bands | Operating mode | Duty Cycle used for SAR testing |
|--|--|---|--|
| GSM | 850 1900 | Voice (GMSK) GPRS (GMSK) EGPRS (8PSK) | GPRS Multi-Slot Class: <input type="checkbox"/> Class 8 - 1 Up, 4 Down <input type="checkbox"/> Class 10 - 2 Up, 4 Down <input type="checkbox"/> Class 12 - 4 Up, 4 Down <input checked="" type="checkbox"/> Class 33 - 4 Up, 5 Down |
| Does this device support DTM (Dual Transfer Mode)? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | | | |
| W-CDMA (UMTS) | Band II Band V | UMTS Rel. 99 (Voice & Data) HSDPA (Category 24) HSUPA (Category 6) DC-HSDPA (Category 24) HSPA+ (DL only) | 100% |
| Does this device support SV-LTE (1xRTT-LTE)? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | | | |
| NR (Sub6) | FDD Band n2 FDD Band n5 FDD Band n66 TDD Band n77 <small>Power class 3</small> TDD Band n77 <small>Power class 2</small> | DFT-s-OFDM: <input checked="" type="checkbox"/> π/2 BPSK, QPSK, 16QAM, 64QAM, 256QAM CP-OFDM: <input checked="" type="checkbox"/> QPSK, 16QAM, 64QAM, 256QAM | 100% |
| Wi-Fi | 2.4 GHz | 802.11b / 802.11g/802.11n (HT20) | 98.8% <small>(802.11b)</small> |
| | 5 GHz | 802.11a / 802.11n (HT20) & (HT40) 802.11ac (VHT20) & (VHT40) & (VHT80) | 98.7% <small>(802.11a)</small> 98.5% <small>(802.11ac (VHT80))</small> |
| Does this device support bands 5.60 ~ 5.65 GHz? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | | | |
| Does this device support Band gap channel(s)? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | | | |
| Bluetooth | 2.4 GHz | Version 5.3 LE | 76.7% (DH5) |
| NFC | 13.56 MHz | Type A/B/C | 100% |

Notes:

- The Bluetooth protocol is considered source-based averaging. Bluetooth GFSK (DH5) was verified to have the highest duty cycle of 76.7% and was considered and used for SAR Testing.
- Duty cycle for Wi-Fi is referenced from the DTS and UNII report.
- This device supports Power Class 2(HPUE) and Power Class 3 for NR Band n77
- This device supports UL CA intra-band non-continues.
- NR TDD Band n77 has support SRS(0,1,2,3) modes.
- Measured Duty Cycle is not required due to SAR test exemption.

5.2. Time-Averaging for SAR

This device is enabled with Qualcomm Smart Transmit algorithm to control and manage transmitting power in real time and to ensure that the time-averaged RF exposure from 2G/3G/4G/5G NR Sub6 WWAN is compliance with FCC requirement. This part.0 report shows SAR characterization of WWAN radios for 2G/3G/4G/5G NR Sub6. Characterization is achieved by determining P_{limit} for 2G/3G/4G/5G NR Sub6 that correspond to the SAR_design_target after accounting for all device design related uncertainty. The SAR Characterization is denoted as SAR Char in this report.

5.3. Nomenclature for Part 0 Report

| Technology | Term | Description |
|-------------------------|-----------------------|---|
| 2G/3G/4G/ 5G NR Sub6 | P_{limit} | Power level that corresponds to the exposure design target (SAR_design_target) after accounting for all device design related uncertainties |
| | P_{max} | Maximum tune up output power |
| | SAR_design_target | Target SAR level < FCC SAR limit after accounting for all device design related uncertainties |
| | SAR Char | Table containing P_{limit} for all technologies and bands |

6. SAR Characterizations

6.1. SAR Design Target

SAR_Design_target is determined by ensuring that it is less than FCC SAR limit after accounting for total device designed related uncertainties specified by the manufacturer.

| <i>SAR_design_target</i> | | | |
|--|-----------------|-----------------------------|-----------------|
| <i>SAR_design_target < SAR_regulatory_limit × 10^{-Total Uncertainty}</i> | | | |
| 1g SAR (W/kg) | | 10g SAR (W/kg) | |
| Total Uncertainty | 1.0 dB | Total Uncertainty | 1.0 dB |
| SAR_regulatory_limit | 1.6 W/kg | SAR_regulatory_limit | 4.0 W/kg |
| SAR_design_target | 1.0 W/kg | SAR_design_target | 2.5 W/kg |

6.2. DS1 and SAR Determination

This device uses different Device State Index (DSI) to configure different time averaged power levels based on certain exposure scenarios. Depending on the detection scheme implemented in the Tablet, the worst-case SAR was determined by measurements for the relevant exposure conditions for that DSI. Detailed descriptions of the detection mechanisms are included in the operational description.

The device state index (DSI) conditions used in below table represent different exposure scenarios.

DSI and Corresponding Exposure Scenarios

| RF exposure Scenarios | DSI No. | Description | KDB guide For SAR test |
|-----------------------|---------|--|----------------------------------|
| Head exposure | 2 | 1. Next to the ear exposure condition. 2. Handset's Receiver(ear piece) is active during voice or VoIP call. | KDB 648474 D04 |
| Body-worn exposure | 0 | 1. Handset are used with body-worn accessories. | KDB 648474 D04 |
| Hotspot exposure | 3 | 1. SAR test requirements for Handset with wireless router or hotspot mode capabilities. 2. Hotspot mode SAR test for Near body use condition. | KDB 941225 D06 |
| Product Specific 10-g | 1 or 4 | 1. Hand use conditions for Handset(Phablet) and Proximity sensor is triggered 2. Connected ear-jack. | KDB 648474 D04 KDB 616217 D04 |
| | 0 | 1. Hand use conditions for Handset(Phablet) and Proximity sensor is not triggered. | KDB 648474 D04 KDB 616217 D04 |

6.3. SAR Char

SAR results corresponding to P_{max} for each antenna/technology/band/DSI can be found in Section.7. P_{limit} is calculated by linearly scaling with the measured SAR at the P_{max} to correspond to the *SAR_design_target*. P_{limit} determination for each exposure scenario corresponding to *SAR_design_target* are shown in table.

P_{limit} Determination

| Device State Index (DSI) | P_{limit} Determination Scenarios |
|--------------------------|---|
| DSI = 0 | The worst-case SAR exposure is determined as maximum SAR normalized to the limit among; <ol style="list-style-type: none"> 1. Body-worn exposure SAR 2. Product Specific 10-g SAR measured at 13, 6 and 7 mm spacing for Back, Edge.2, Edge.3 3. Product Specific 10-g SAR measured at 0 mm for Front, Edge1, Edge4. |
| DSI = 1 or 4 | 1. P_{limit} is calculated based on Product Specific 10-g SAR at 0 mm for Back, Edge2, Edge 3. |
| DSI = 2 | 1. P_{limit} is calculated based on Head exposure SAR |
| DSI = 3 | 1. P_{limit} is calculated based on Hotspot SAR at 10mm. |

Notes:

For DSI = 0, P_{limit} is calculated by:

Main.1 Ant

$P_{limit} = \min\{ P_{limit} \text{ corresponding to 1g Body worn SAR evaluation at 15mm spacing,}$

$P_{limit} \text{ corresponding to Product specific 10g SAR evaluation at 13(Rear), 6(Edge2). 7(Edge3) mm spacing,}$

$P_{limit} \text{ corresponding to Product specific 10g SAR evaluation at 0 mm for Front and Edge4 surfaces}\}$

Main.2 Ant

$P_{limit} = \min\{ P_{limit} \text{ corresponding to 1g Body worn SAR evaluation at 15mm spacing,}$

$P_{limit} \text{ corresponding to Product specific 10g SAR evaluation at 13(Rear). 7(Edge3) mm spacing,}$

$P_{limit} \text{ corresponding to Product specific 10g SAR evaluation at 0 mm for Front and Edge4 surfaces}\}$

Other Antennas (Sub.3 / Sub.5 / Sub.2)

$P_{limit} = \min\{ P_{limit} \text{ corresponding to 1g Body worn SAR evaluation at 15 mm spacing,}$

$P_{limit} \text{ corresponding to Product specific 10g SAR evaluation at 0 mm on all surfaces and side edges with each antenna}$

$\text{location at within 25mm from that surface or edge.}\}$

SAR Characterizations

Notes:

1. If P_{limit} is higher than P_{max} for some modes / bands, The modes/bands will operate at a power level up to P_{max} .
2. P_{max} (Maximum tune-up power) is specified in tune-up document. The maximum allowed power is equal to maximum tune up power + 1 dB device design uncertainty.
3. All P_{limit} EFS and maximum tune up output P_{max} levels entered in above Table correspond to average power levels after accounting for duty cycle in the case of TDD modulation schemes (e.g GSM and LTE TDD).
4. $P_{limit}(\text{DSI}=0)$ was determined to be the lower of "Body-worn" and "Product Specific 10-g at Max power" in each WWAN Bands.
5. Some band's DSIs were determined more conservative P_{limit} instead of calculation P_{limit} in Section.7.

7. SAR Test results for P_{limit} calculations

| | | | | | | 0 | Edge 3 | 21.52 | 0.879 | 26.06 | |

Notes:

1. The maximum allowed power is equal to maximum tune up power + 1 dB device design uncertainty
2. Measured Output power refer to Sec.9 in SAR part.1 report.
3. Some bands were determined more conservative P_{limit} instead of calculation P_{limit} .
