CALIBRATION CERTIFICATE

Object
ES3DV3 - SN:3347

Calibration procedure(s)
QA CAL-01,v9, QA CAL-23.v5, QA CAL-25.v6 Calibration procedure for dosimetric E-field probes

Calibration date:
March 27, 2018

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$

Calibration Equipment used (M\&TE critical for calibration)

The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates

## Glossary:

TSL
NORMx,y,z
ConvF
DCP
CF
A, B, C, D
Polarization $\varphi$
Polarization $\vartheta$
Connector Angle
tissue simulating liquid sensitivity in free space sensitivity in TSL / NORMx,y,z diode compression point crest factor (1/duty_cycle) of the RF signal modulation dependent linearization parameters $\varphi$ rotation around probe axis $\vartheta$ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta=0$ is normal to probe axis information used in DASY system to align probe sensor X to the robot coordinate system

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization $\vartheta=0$ ( $f \leq 900 \mathrm{MHz}$ in TEM-cell; $f>1800 \mathrm{MHz}$ : R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORM $x, y, z$ does not affect the $E^{2}$-field uncertainty inside TSL (see below ConvF).
- $\operatorname{NORM}(f) x, y, z=N O R M x, y, z$ * frequency response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- $A x, y, z ; B x, y, z ; C x, y, z ; D x, y, z ; \vee R x, y, z: A, B, C, D$ are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. $V R$ is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for $\mathrm{f} \leq 800 \mathrm{MHz}$ ) and inside waveguide using analytical field distributions based on power measurements for $f>800 \mathrm{MHz}$. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z *ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from $\pm 50 \mathrm{MHz}$ to $\pm 100$ MHz .
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

# Probe ES3DV3 

## SN:3347

Manufactured: March 15, 2012

Repaired:
Calibrated:

March 15, 2018
March 27, 2018

Calibrated for DASY/EASY Systems
(Note: non-compatible with DASY2 system!)

## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3347

Basic Calibration Parameters

|  | Sensor X | Sensor $Y$ | Sensor $\mathbf{Z}$ | Unc (k=2) |
| :--- | :---: | :---: | :---: | :---: |
| Norm $\left(\mu \mathrm{V} /(\mathrm{V} / \mathrm{m})^{2}\right)^{\mathrm{A}}$ | 1.15 | 1.18 | 1.21 | $\pm 10.1 \%$ |
| $\mathrm{DCP}(\mathrm{mV})^{\mathrm{B}}$ | 101.9 | 105.1 | 102.9 |  |

## Modulation Calibration Parameters

| UID | Communication System Name |  | $\mathbf{A}$ <br> $\mathbf{d B}$ | $\mathbf{B}$ <br> $\mathbf{d B} \sqrt{ } \mathbf{\mu} \mathbf{V}$ | $\mathbf{C}$ | $\mathbf{D}$ <br> $\mathbf{d B}$ | $\mathbf{V R}$ <br> $\mathbf{m V}$ | $\mathbf{U n c}^{\mathbf{E}}$ <br> $\mathbf{k}=\mathbf{2})$ |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | CW | X | 0.0 | 0.0 | 1.0 | 0.00 | 201.8 | $\pm 3.3 \%$ |
|  |  | Y | 0.0 | 0.0 | 1.0 |  | 203.9 |  |
|  |  | Z | 0.0 | 0.0 | 1.0 |  | 204.8 |  |

Note: For details on UID parameters see Appendix.
Sensor Model Parameters

|  | $\mathbf{C 1}$ <br> $\mathbf{f F}$ | $\mathbf{C 2}$ <br> $\mathbf{f F}$ | $\mathbf{\alpha}$ <br> $\mathbf{V}^{-\mathbf{1}}$ | $\mathbf{T 1}$ <br> $\mathbf{m s .} \mathbf{V}^{-\mathbf{2}}$ | $\mathbf{T 2}$ <br> $\mathbf{m s . \mathbf { V } ^ { - 1 }}$ | $\mathbf{T 3}$ <br> $\mathbf{m s}$ | $\mathbf{T 4}$ <br> $\mathbf{V}^{\mathbf{- 2}}$ | $\mathbf{T 5}$ <br> $\mathbf{V}^{\mathbf{- 1}}$ | $\mathbf{T 6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | 52.41 | 376.6 | 35.43 | 28.01 | 1.852 | 5.10 | 0.578 | 0.488 | 1.008 |
| Y | 42.65 | 300.9 | 34.31 | 25.12 | 1.310 | 5.10 | 1.279 | 0.204 | 1.011 |
| Z | 48.12 | 344.8 | 35.26 | 27.10 | 1.587 | 5.10 | 0.868 | 0.385 | 1.009 |

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.
${ }^{\text {A }}$ The uncertainties of Norm $X, Y, Z$ do not affect the $E^{2}$-field uncertainty inside TSL (see Pages 5 and 6).
${ }^{\mathrm{B}}$ Numerical linearization parameter: uncertainty not required.
${ }^{\text {E }}$ Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

## CALIBRATION CERTIFICATE

Object ES3DV3 - SN:3287

Catibration procedure(s)
QA CAL-01.v9, QA CAL-23.v5, QA CAL-25.v6 Calibration procedure for dosimetric E-field probes

September 18, 2017

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate. All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidily $<70 \%$.

Calibration Equipment used (M\&TE critical for calibration)

Glossary:
TSL
NORMx, y , z
ConvF
DCP
CF
A, B, C, D
Polarization $\varphi$
tissue simulating liquid
sensitivity in free space
sensitivity in TSL / NORMx,y,z
diode compression point
crest factor (1/duty_cycle) of the RF signal
modulation dependent linearization parameters
$\varphi$ rotation around probe axis
Polarization $\vartheta \quad \vartheta$ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $9=0$ is normal to probe axis

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Methods Applied and Interpretation of Parameters:

- NORM $x, y, z$ : Assessed for E-field polarization $9=0$ ( $f \leq 900 \mathrm{MHz}$ in TEM-cell; $f>1800 \mathrm{MHz}$ : R22 waveguide). NORM $x, y, z$ are only intermediate values, i.e., the uncertainties of NORM $x, y, z$ does not affect the $E^{2}$-field uncertainty inside TSL (see below ConvF).
- $N O R M(f) x, y, z=N O R M X, y, z *$ frequency_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; $B x, y, z ; C x, y, z ; D x, y, z ; V R x, y, z: A, B, C, D$ are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. $V R$ is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for $f \leq 800 \mathrm{MHz}$ ) and inside waveguide using analytical field distributions based on power measurements for $f>800 \mathrm{MHz}$. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z * ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from $\pm 50 \mathrm{MHz}$ to $\pm 100$ MHz .
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMX (no uncertainty required).

# Probe ES3DV3 

## SN:3287

Manufactured: June 7, 2010
Calibrated: September 18, 2017

## Calibrated for DASY/EASY Systems

(Note: non-compatible with DASY2 system!)

## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3287

Basic Calibration Parameters

|  | Sensor $\mathbf{X}$ | Sensor $\mathbf{Y}$ | Sensor $\mathbf{Z}$ | Unc $(\mathbf{k}=\mathbf{2 )}$ |
| :--- | :---: | :---: | :---: | :---: |

## Cerificate No: ES3-3319. Mar18

## CALIBRATION CERTIFICATE

| Object | ES3DV3 - SN:3319 |  |
| :---: | :---: | :---: |
| Calibration procedure(s) | QA CAL-01.v9, QA CAL-23.v5, QA CAL-25.v6 Calibration procedure for dosimetric E-field probes |  |
| Calibration date: | March 13, 2018 |  |

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.

Calibration Equipment used (M\&TE critical for calibration)

| Primary Standards | ID | Cal Date (Certificate No.) | Scheduled Calibration |
| :---: | :---: | :---: | :---: |

## Glossary:

TSL
NORMx,y,z
ConvF
DCP
CF
A, B, C, D
Polarization $\varphi$
Polarization $\vartheta$

```
tissue simulating liquid sensitivity in free space sensitivity in TSL / NORM \(x, y, z\) diode compression point crest factor (1/duty_cycle) of the RF signal modulation dependent linearization parameters \(\varphi\) rotation around probe axis \(\vartheta\) rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., \(\vartheta=0\) is normal to probe axis
Connector Angle information used in DASY system to align probe sensor \(X\) to the robot coordinate system
```

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization $\vartheta=0$ ( $f \leq 900 \mathrm{MHz}$ in TEM-cell; $\mathrm{f}>1800 \mathrm{MHz}$ : R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORM $x, y, z$ does not affect the $E^{2}$-field uncertainty inside TSL (see below ConvF).
- NORM(f) $x, y, z=$ NORM $M, y, z$ * frequency_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- $A x, y, z ; B x, y, z ; C x, y, z ; D x, y, z ; V R x, y, z: A, B, C, D$ are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for $f \leq 800 \mathrm{MHz}$ ) and inside waveguide using analytical field distributions based on power measurements for $\mathrm{f}>800 \mathrm{MHz}$. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from $\pm 50 \mathrm{MHz}$ to $\pm 100$ MHz .
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMX (no uncertainty required).

# Probe ES3DV3 

## SN:3319

Manufactured: January 10, 2012
Calibrated: $\quad$ March 13,2018

Calibrated for DASY/EASY Systems
(Note: non-compatible with DASY2 system!)

## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3319

## Basic Calibration Parameters

|  | Sensor $X$ | Sensor $\mathbf{Y}$ | Sensor $\mathbf{Z}$ | Unc (k=2) |

| Norm $\left(\mu \mathrm{V} /(\mathrm{V} / \mathrm{m})^{2}\right)^{\mathrm{A}}$ | 1.08 | 1.05 | 1.12 | $\pm 10.1 \%$ |
| $\mathrm{DCP}(\mathrm{mV})^{\mathrm{B}}$ | 104.0 | 103.0 | 104.0 |  |

Modulation Calibration Parameters

| UID | Communication System Name |  | $\mathbf{A}$ <br> $\mathbf{d B}$ | $\mathbf{B}$ <br> $\mathbf{d B} \sqrt{ } \mathbf{~} \mathbf{V}$ | $\mathbf{C}$ | $\mathbf{D}$ <br> $\mathbf{d B}$ | $\mathbf{V R}$ <br> $\mathbf{m V}$ | $\mathbf{U n c}^{\mathbf{E}}$ <br> $\mathbf{( k = 2 )}$ |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | CW | X | 0.0 | 0.0 | 1.0 | 0.00 | 197.9 | $\pm 3.8 \%$ |
|  |  | Y | 0.0 | 0.0 | $\mathbf{1 . 0}$ |  | 198.2 |  |
|  |  | Z | 0.0 | 0.0 | 1.0 |  | 200.6 |  |

Note: For details on UID parameters see Appendix.

Sensor Model Parameters

|  | $\mathbf{C 1}$ <br> $\mathbf{f F}$ | $\mathbf{C 2}$ <br> $\mathbf{f F}$ | $\mathbf{\alpha}$ <br> $\mathbf{V}^{\mathbf{- 1}}$ | $\mathbf{T 1}$ <br> $\mathbf{m s .} \mathbf{V}^{-\mathbf{2}}$ | $\mathbf{T 2}$ <br> $\mathbf{m s} . \mathbf{V}^{-1}$ | $\mathbf{T 3}$ <br> $\mathbf{m s}$ | $\mathbf{T} 4$ <br> $\mathbf{V}^{-\mathbf{2}}$ | $\mathbf{T} 5$ <br> $\mathbf{V}^{-1}$ | $\mathbf{T 6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | 60.52 | 430.8 | 35.08 | 29.64 | 3.011 | 5.10 | 0.615 | 0.538 | 1.010 |
| Y | 55.79 | 400.8 | 35.48 | 29.01 | 2.492 | 5.10 | 0.600 | 0.518 | 1.009 |
| Z | 63.98 | 455.3 | 34.93 | 29.72 | 3.442 | 5.10 | 0.679 | 0.571 | 1.011 |

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

[^7]
## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3319

Calibration Parameter Determined in Head Tissue Simulating Media

| $\mathrm{f}(\mathrm{MHz})^{\mathrm{C}}$ | Relative Permittivity ${ }^{\text {F }}$ | Conductivity $(\mathrm{S} / \mathrm{m})^{\mathrm{F}}$ | ConvF X | ConvF Y | ConvF Z | Alpha ${ }^{\text {G }}$ | $\begin{gathered} \text { Depth }^{6} \\ (\mathrm{~mm}) \end{gathered}$ | $\begin{gathered} \text { Unc } \\ (\mathrm{k}=2) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 750 | 41.9 | 0.89 | 6.70 | 6.70 | 6.70 | 0.80 | 1.21 | $\pm 12.0 \%$ |
| 835 | 41.5 | 0.90 | 6.44 | 6.44 | 6.44 | 0.80 | 1.17 | $\pm 12.0 \%$ |
| 1750 | 40.1 | 1.37 | 5.49 | 5.49 | 5.49 | 0.65 | 1.43 | $\pm 12.0 \%$ |
| 1900 | 40.0 | 1.40 | 5.29 | 5.29 | 5.29 | 0.76 | 1.30 | $\pm 12.0$ \% |
| 2300 | 39.5 | 1.67 | 5.06 | 5.06 | 5.06 | 0.72 | 1.29 | $\pm 12.0 \%$ |
| 2450 | 39.2 | 1.80 | 4.71 | 4.71 | 4.71 | 0.77 | 1.30 | $\pm 12.0$ \% |
| 2600 | 39.0 | 1.96 | 4.55 | 4.55 | 4.55 | 0.80 | 1.31 | $\pm 12.0 \%$ |

${ }^{c}$ Frequency validity above 300 MHz of $\pm 100 \mathrm{MHz}$ only applies for DASY v4.4 and higher (see Page 2), else it is restricted to $\pm 50 \mathrm{MHz}$. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is $\pm 10,25,40,50$ and 70 MHz for ConvF assessments at $30,64,128,150$ and 220 MHz respectively. Above 5 GHz frequency validity can be extended to $\pm 110 \mathrm{MHz}$.
${ }^{F}$ At frequencies below 3 GHz , the validity of tissue parameters ( $\varepsilon$ and $\sigma$ ) can be relaxed to $\pm 10 \%$ if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz , the validity of tissue parameters ( $\varepsilon$ and $\sigma$ ) is restricted to $\pm 5 \%$. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
${ }^{G}$ Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than $\pm 1 \%$ for frequencies below 3 GHz and below $\pm 2 \%$ for frequencies between $3-6 \mathrm{GHz}$ at any distance larger than half the probe tip diameter from the boundary.

${ }^{c}$ Frequency validity above 300 MHz of $\pm 100 \mathrm{MHz}$ only applies for DASY v4.4 and higher (see Page 2), else it is restricted to $\pm 50 \mathrm{MHz}$. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncerlainty for the indicated frequency band. Frequency validity below 300 MHz is $\pm 10,25,40,50$ and 70 MHz for ConvF assessments at $30,64,128,150$ and 220 MHz respectively. Above 5 GHz frequency validity can be extended to $\pm 110 \mathrm{MHz}$.
${ }^{F}$ At frequencies below 3 GHz , the validity of tissue parameters ( $\epsilon$ and $\sigma$ ) can be relaxed to $\pm 10 \%$ if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz , the validity of tissue parameters ( E and $\sigma$ ) is restricted to $\pm 5 \%$. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
${ }^{6}$ Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than $\pm 1 \%$ for frequencies below 3 GHz and below $\pm 2 \%$ for frequencies between $3-6 \mathrm{GHz}$ at any distance larger than half the probe tip diameter from the boundary.

Frequency Response of E-Field
(TEM-Cell:ifi110 EXX, Waveguide: R22)

Uncertainty of Frequency Response of Enfield: $\pm 6.3 \%(k=2)$

## Receiving Pattern ( $\phi$ ), $\vartheta=0^{\circ}$

$\mathrm{f}=600 \mathrm{MHz}$,TEM

$\mathrm{f}=1800 \mathrm{MHz}, \mathrm{R} 22$

Uncertainty of Axial Isotropy Assessment: $\pm \mathbf{0 . 5 \%}(\mathrm{k}=2$ )

## Dynamic Range f(SAR head $)$ <br> (TEM cell , $\mathrm{f}_{\text {eval }}=1900 \mathrm{MHz}$ )

Uncertainty of Linearity Assessment: $\mathbf{\pm 0 . 6 \%}$ ( $\mathbf{k = 2}$ )

## Conversion Factor Assessment

Error ( $\phi, \vartheta$ ), f=900 MHz

## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3319

Other Probe Parameters

| Sensor Arrangement | Triangular |
| :--- | ---: |
| Connector Angle ( ${ }^{\circ}$ ) | 60.4 |
| Mechanical Surface Detection Mode | enabled |
| Optical Surface Detection Mode | disabled |
| Probe Overall Length | 337 mm |
| Probe Body Diameter | 10 mm |
| Tip Length | 10 mm |
| Tip Diameter | 4 mm |
| Probe Tip to Sensor X Calibration Point | 2 mm |
| Probe Tip to Sensor Y Calibration Point | 2 mm |
| Probe Tip to Sensor Z Calibration Point | 2 mm |
| Recommended Measurement Distance from Surface | 3 mm |

CALIBRATION CERTIFICATE

Object
EX3DV4 - SN:7357

Calibration procedure(s)

Calibration date:

QA CAL-01.v9, QA CAL-12.v9, QA CAL-14.v4, QA CAL-23.v5, QA CAL-25.v6 Calibration procedure for dosimetric E-field probes

Apil 18, 2018

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.
Calibration Equipment used (M\&TE critical for calibration)

Glossary:
TSL
NORM $x, y, z$
ConvF
DCP
CF
A, B, C, D
Polarization $\varphi$
tissue simulating liquid sensitivity in free space sensitivity in TSL / NORM $x, y, z$ diode compression point crest factor ( $1 /$ duty_cycle) of the RF signal modulation dependent linearization parameters $\varphi$ rotation around probe axis
Polarization $\vartheta \quad \vartheta$ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta=0$ is normal to probe axis

Connector Angle information used in DASY system to align probe sensor $X$ to the robot coordinate system

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization $9=0$ ( $f \leq 900 \mathrm{MHz}$ in TEM-cell; $\mathrm{f}>1800 \mathrm{MHz}$ : R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORM $x, y, z$ does not affect the $E^{2}$-field uncertainty inside TSL (see below ConvF).
- $N O R M(f) x, y, z=N O R M x, y, z *$ frequency_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- $A x, y, z ; B x, y, z ; C x, y, z ; D x, y, z ; V R x, y, z: A, B, C, D$ are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. $V R$ is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for $f \leq 800 \mathrm{MHz}$ ) and inside waveguide using analytical field distributions based on power measurements for $f>800 \mathrm{MHz}$. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z * ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from $\pm 50 \mathrm{MHz}$ to $\pm 100$ MHz .
- Spherical isotropy ( $3 D$ deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMX (no uncertainty required).

# Probe EX3DV4 

## SN:7357

Manufactured: February 5, 2015
Calibrated:
April 18, 2018

Calibrated for DASY/EASY Systems
(Note: non-compatible with DASY2 system!)

## DASY/EASY - Parameters of Probe: EX3DV4 - SN:7357

## Basic Calibration Parameters

|  | Sensor $\mathbf{X}$ | Sensor $\mathbf{Y}$ | Sensor $\mathbf{Z}$ | Unc (k=2) |
| :--- | :---: | :---: | :---: | :---: |
| Norm $\left(\mu \mathrm{V} /(\mathrm{V} / \mathrm{m})^{2}\right)^{\mathrm{A}}$ | 0.37 | 0.48 | 0.40 | $\pm 10.1 \%$ |
| DCP $(\mathrm{mV})^{\mathrm{B}}$ | 89.1 | 99.1 | 96.4 |  |

## Modulation Calibration Parameters

| UID | Communication System Name |  | $\mathbf{A}$ <br> $\mathbf{d B}$ | $\mathbf{B}$ <br> $\mathbf{d B} \sqrt{ } \boldsymbol{\mu} \mathbf{V}$ | $\mathbf{C}$ | $\mathbf{D}$ <br> $\mathbf{d B}$ | $\mathbf{V R}$ <br> $\mathbf{m V}$ | $\mathbf{U n c}^{\mathbf{E}}$ <br> $(\mathbf{k}=\mathbf{2})$ |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | 37.91 | 303.3 | 40.25 | 6.413 | 0.832 | 4.998 | 0.00 | 0.454 | 1.006 |
| Y | 48.33 | 363.1 | 36.01 | 10.58 | 0.113 | 5.100 | 0.00 | 0.458 | 1.004 |
| Z | 39.38 | 305.2 | 38.03 | 5.76 | 0.610 | 5.046 | 0.00 | 0.461 | 1.008 |

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

[^9]

| 450 | 43.5 | 0.87 | 11.17 | 11.17 | 11.17 | 0.14 | 1.20 | $\pm 13.3 \%$ |
| 750 | 41.9 | 0.89 | 10.50 | 10.50 | 10.50 | 0.45 | 0.85 | $\pm 12.0 \%$ |
| 835 | 41.5 | 0.90 | 10.11 | 10.11 | 10.11 | 0.37 | 0.93 | $\pm 12.0 \%$ |
| 1750 | 40.1 | 1.37 | 8.80 | 8.80 | 8.80 | 0.38 | 0.86 | $\pm 12.0 \%$ |
| 1900 | 40.0 | 1.40 | 8.47 | 8.47 | 8.47 | 0.18 | 0.83 | $\pm 12.0 \%$ |
| 2300 | 39.5 | 1.67 | 7.83 | 7.83 | 7.83 | 0.33 | 0.86 | $\pm 12.0$ \% |
| 2450 | 39.2 | 1.80 | 7.43 | 7.43 | 7.43 | 0.37 | 0.89 | $\pm 12.0 \%$ |
| 2600 | 39.0 | 1.96 | 7.13 | 7.13 | 7.13 | 0.27 | 0.98 | $\pm 12.0 \%$ |
| 5250 | 35.9 | 4.71 | 5.62 | 5.62 | 5.62 | 0.35 | 1.80 | $\pm 13.1$ \% |
| 5600 | 35.5 | 5.07 | 4.93 | 4.93 | 4.93 | 0.40 | 1.80 | $\pm 13.1$ \% |
| 5750 | 35.4 | 5.22 | 5.23 | 5.23 | 5.23 | 0.40 | 1.80 | $\pm 13.1$ \% |

${ }^{c}$ Frequency validity above 300 MHz of $\pm 100 \mathrm{MHz}$ only applies for DASY v4.4 and higher (see Page 2), else it is restricted to $\pm 50 \mathrm{MHz}$. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is $\pm 10,25,40,50$ and 70 MHz for ConvF assessments at $30,64,128,150$ and 220 MHz respectively. Above 5 GHz frequency validity can be extended to $\pm 110 \mathrm{MHz}$.
${ }^{F}$ At frequencies below 3 GHz , the validity of tissue parameters ( E and $\sigma$ ) can be relaxed to $\pm 10 \%$ if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz , the validity of tissue parameters ( E and $\sigma$ ) is restricted to $\pm 5 \%$. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
${ }^{G}$ Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than $\pm 1 \%$ for frequencies below 3 GHz and below $\pm 2 \%$ for frequencies between $3-6 \mathrm{GHz}$ at any distance larger than half the probe tip diameter from the boundary.

## CALIBRATION CERTIFICATE

Object
D750V3 - SN:1161
Calibration procedure(s)

QA CAL-05.v9 Calibration procedure for dipole validation kits above 700 MHz

Calibration date:
July 13,2016

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz )", February 2005
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz$)$ ", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| DASY Version | DASY5 | V52.8.8 |
| :--- | :---: | :---: |
| Extrapolation | Advanced Extrapolation |  |
| Phantom | Modular Flat Phantom |  |
| Distance Dipole Center - TSL | 15 mm | with Spacer |
| Zoom Scan Resolution | $\mathrm{dx}, \mathrm{dy}, \mathrm{dz}=5 \mathrm{~mm}$ |  |
| Frequency | $750 \mathrm{MHz} \pm 1 \mathrm{MHz}$ |  |

## Head TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Head TSL parameters | $22.0^{\circ} \mathrm{C}$ | 41.9 | $0.89 \mathrm{mho} / \mathrm{m}$ |
| Measured Head TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $40.9 \pm 6 \%$ | $0.91 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Head TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $\ldots--$ | $\ldots--$ |

SAR result with Head TSL

| SAR averaged over $1 \mathrm{~cm}^{\mathbf{3}} \mathbf{( 1 \mathbf { g } ) \text { of Head TSL }}$ | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.09 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{8 . 1 7} \mathbf{W} / \mathrm{kg} \pm \mathbf{1 7 . 0} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\left.10 \mathrm{~cm}^{\mathbf{3}} \mathbf{( 1 0 ~ g}\right)$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.37 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $5.39 \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathbf{k}=\mathbf{2})$ |

## Body TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 55.5 | $0.96 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $55.1 \pm 6 \%$ | $0.99 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $\ldots--$ | $\ldots--$ |

## SAR result with Body TSL

| SAR averaged over $1 \mathrm{~cm}^{\mathbf{3}} \mathbf{( 1 \mathrm { g } ) \text { of Body TSL }}$ | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.16 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $8.43 \mathrm{~W} / \mathbf{k g} \pm 17.0 \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\left.10 \mathrm{~cm}^{\mathbf{3}} \mathbf{( 1 0 ~ g}\right)$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.41 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $5.53 \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathbf{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $55.6 \Omega-0.9 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -25.4 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $50.2 \Omega-4.0 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -28.0 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.033 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |
| :--- | :---: |
| Manufactured on | November 19, 2015 |

DASY5 Validation Report for Head TSL
Date: 13.07.2016
Test Laboratory: SPEAG, Zurich, Switzerland
DUT: Dipole 750 MHz ; Type: D750V3; Serial: D750V3 - SN:1161
Communication System: UID 0 - CW; Frequency: 750 MHz
Medium parameters used: $\mathrm{f}=750 \mathrm{MHz} ; \sigma=0.91 \mathrm{~S} / \mathrm{m} ; \varepsilon_{\mathrm{r}}=40.9 ; \rho=1000 \mathrm{~kg} / \mathrm{m}^{3}$
Phantom section: Flat Section
Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)
DASY52 Configuration:

- Probe: EX3DV4 - SN7349; ConvF(10.07, 10.07, 10.07); Calibrated: 15.06.2016;
- Sensor-Surface: 1.4 mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn601; Calibrated: 30.12.2015
- Phantom: Flat Phantom 4.9L; Type: QD000P49AA; Serial: 1001
- DASY52 52.8.8(1258); SEMCAD X 14.6.10(7372)

## Dipole Calibration for Head Tissue/Pin=250 mW, $\mathbf{d = 1 5 m m} /$ Zoom Scan (7x7x7)/Cube 0:

Measurement grid: $\mathrm{dx}=5 \mathrm{~mm}, \mathrm{dy}=5 \mathrm{~mm}, \mathrm{dz}=5 \mathrm{~mm}$
Reference Value $=58.07 \mathrm{~V} / \mathrm{m}$; Power Drift $=-0.00 \mathrm{~dB}$
Peak SAR (extrapolated) $=3.13 \mathrm{~W} / \mathrm{kg}$
$\operatorname{SAR}(1 \mathrm{~g})=2.09 \mathrm{~W} / \mathrm{kg} ; \operatorname{SAR}(10 \mathrm{~g})=1.37 \mathrm{~W} / \mathrm{kg}$
Maximum value of SAR (measured) $=2.80 \mathrm{~W} / \mathrm{kg}$

## Impedance Measurement Plot for Head TSL

## DIPOLE CALIBRATION EXTENSION

Per KDB 865664 D01, calibration intervals of up to three years may be considered for reference dipoles when it is demonstrated that the SAR target, impedance and return loss of a dipole have remained stable according to the following requirements:

1. The measured SAR does not deviate more than $10 \%$ from the target on the calibration certificate.
2. The return-loss does not deviate more than $20 \%$ from the previous measurement and meets the required 20dB minimum return-loss requirement.
3. The measurement of real or imaginary parts of impedance does not deviate more than $5 \Omega$ from the previous measurement.
The following dipole was checked to pass the above 3 requirements to have 2 -year calibration period from the calibration date:

TSL tissue simulating liquid
ConvF sensitivity in TSL / NORM $x, y, z$
N/A not applicable or not measured

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.
The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

## Client PC Test <br> CALIBRATION CERTIFICATE

Accreditation No.: SCS 0108

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.

| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{1 9 . 9} \mathrm{~W} / \mathbf{k g} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $51.7 \Omega+2.5 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -30.4 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $47.6 \Omega+1.3 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -31.1 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.222 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Glossary:

TSL tissue simulating liquid
ConvF sensitivity in TSL / NORM $x, y, z$
N/A not applicable or not measured

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| DASY Version | DASY5 | V52.10.0 |
| :--- | :---: | :---: |
| Extrapolation | Advanced Extrapolation |  |
| Phantom | Modular Flat Phantom |  |
| Distance Dipole Center - TSL | 10 mm | with Spacer |
| Zoom Scan Resolution | $\mathrm{dx}, \mathrm{dy}, \mathrm{dz}=5 \mathrm{~mm}$ |  |
| Frequency | $1900 \mathrm{MHz} \pm 1 \mathrm{MHz}$ |  |

## Head TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Head TSL parameters | $22.0^{\circ} \mathrm{C}$ | 40.0 | $1.40 \mathrm{mho} / \mathrm{m}$ |
| Measured Head TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $41.1 \pm 6 \%$ | $1.35 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Head TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | ---- | ---- |

## SAR result with Head TSL

| SAR averaged over $\mathbf{1} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 \mathbf { g } ) \text { of Head TSL }}$ | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $9.55 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{3 9 . 3} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 7 . 0} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\mathbf{1 0} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 0 \mathbf { g } ) \text { of Head TSL }}$ | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $5.05 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to $\mathbf{1 W}$ | $\mathbf{2 0 . 6} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Body TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 53.3 | $1.52 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $55.3 \pm 6 \%$ | $1.47 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $--{ }^{\circ}$ | --- |

## SAR result with Body TSL

| SAR averaged over $\mathbf{1} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 ~ g )}$ of Body TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $9.73 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{4 0 . 0} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 7 . 0} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\mathbf{1 0} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 0 ~ g )}$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $5.20 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{2 1 . 2} \mathrm{~W} / \mathbf{k g} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $53.4 \Omega+5.9 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -23.6 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $48.8 \Omega+7.2 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -22.6 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.198 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |
| :--- | :---: |
| Manufactured on | March 11, 2011 |

## DASY5 Validation Report for Head TSL

Date: 12.04.2018
Test Laboratory: SPEAG, Zurich, Switzerland

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $52.0 \Omega+1.3 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -32.6 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $48.8 \Omega+3.7 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -28.1 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.156 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz$)^{\prime \prime}$, March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $6.35 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{2 5 . 1} \mathbf{W} / \mathrm{kg} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

Body TSL parameters
The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 52.5 | $2.16 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $52.1 \pm 6 \%$ | $2.19 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $-\ldots-$ | ---- |

## SAR result with Body TSL

| SAR averaged over $1 \mathbf{c m}^{3}(1 \mathrm{~g})$ of Body TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $13.8 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $54.8 \mathrm{~W} / \mathrm{kg} \pm 17.0 \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\mathbf{1 0} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 0 ~ g )}$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $6.20 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{2 4 . 7} \mathbf{W} / \mathrm{kg} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $47.7 \Omega-5.7 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -24.1 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $46.0 \Omega-3.8 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -24.9 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.149 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Appendix (Additional assessments outside the scope of SCS 0108)

Antenna Parameters with Head TSL at 5250 MHz

| Impedance, transformed to feed point | $50.0 \Omega-5.5 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -25.2 dB |

## Antenna Parameters with Head TSL at 5600 MHz

| Impedance, transformed to feed point | $54.7 \Omega-2.1 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -26.2 dB |

## Antenna Parameters with Head TSL at 5750 MHz

| Impedance, transformed to feed point | $52.7 \Omega+0.0 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -31.5 dB |

## Antenna Parameters with Body TSL at 5200 MHz

| Impedance, transformed to feed point | $49.3 \Omega-6.7 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -23.4 dB |

## Antenna Parameters with Body TSL at 5250 MHz

| Impedance, transformed to feed point | $48.4 \Omega-3.9 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -27.4 dB |

## Antenna Parameters with Body TSL at 5600 MHz

| Impedance, transformed to feed point | $55.3 \Omega-1.6 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -25.6 dB |

## Antenna Parameters with Body TSL at 5750 MHz

| Impedance, transformed to feed point | $52.6 \Omega+1.1 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -31.2 dB |

## Antenna Parameters with Body TSL at 5800 MHz

| Impedance, transformed to feed point | $51.8 \Omega-0.4 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -34.9 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.203 ns |
| :--- | :--- |

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |

## Glossary:

TSL
ConvF
N/A
tissue simulating liquid sensitivity in TSL / NORM $x, y, z$ not applicable or not measured

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.
The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| DASY Version | DASY5 | V52.10.0 |
| :--- | :---: | :---: |
| Extrapolation | Advanced Extrapolation |  |
| Phantom | Modular Flat Phantom |  |
| Distance Dipole Center - TSL | 15 mm | with Spacer |
| Zoom Scan Resolution | $\mathrm{dx}, \mathrm{dy}, \mathrm{dz}=5.0 \mathrm{~mm}$ |  |
| Frequency | $750 \mathrm{MHz} \pm 1 \mathrm{MHz}$ |  |

## Head TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Head TSL parameters | $22.0^{\circ} \mathrm{C}$ | 41.9 | $0.89 \mathrm{mho} / \mathrm{m}$ |
| Measured Head TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $40.9 \pm 6 \%$ | $0.90 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Head TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $\ldots--$ | $\ldots$ |

## SAR result with Head TSL

| SAR averaged over $\left.1 \mathrm{~cm}^{\mathbf{3}} \mathbf{1} \mathrm{g}\right)$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.10 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{8 . 2 8} \mathrm{~W} / \mathrm{kg} \pm \mathbf{1 7 . 0} \%(\mathrm{k}=\mathbf{2})$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.37 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{5 . 4 2} \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathrm{k}=2)$ |

## Body TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 55.5 | $0.96 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $55.0 \pm 6 \%$ | $0.96 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | --- | ---- |

SAR result with Body TSL

| SAR averaged over $\mathbf{1 \mathrm { cm } ^ { \mathbf { 3 } } ( 1 \mathrm { g } ) \text { of Body TSL }}$ | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.15 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{8 . 5 8} \mathrm{~W} / \mathrm{kg} \pm \mathbf{1 7 . 0} \%(\mathrm{k}=\mathbf{2})$ |

| SAR averaged over $10 \mathrm{~cm}^{\mathbf{3}}(\mathbf{1 0} \mathrm{g})$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.43 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $5.71 \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathrm{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $53.8 \Omega-2.1 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -27.6 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $49.2 \Omega-6.2 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -24.0 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.043 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |
| :--- | :---: |
| Manufactured on | January 21, 2009 |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Measurement Conditions

DASY system configuration, as far as not given on page 1 and 3 .

CALIBRATION CERTIFICATE

| Object | D835V2 - SN:4d132 |
| :--- | :--- |
| Calibration procedure(s) | QA CAL-05.v9 <br> Calibration procedure for dipole validation kits above 700 MHz |

Calibration date:
January 15, 2018
01-25-2018

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.
All calibrations have been conducted in the closed laboratory facility: environmenl temperalure $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.

Glossary:
TSL tissue simulating liquid
ConvF sensitivity in TSL / NORM $x, y, z$
N/A not applicable or not measured
Calibration is Performed According to the Following Standards:
a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz$)^{\prime \prime}$, March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.
The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| DASY Version | DASY5 | V52.10.0 |
| :--- | :---: | :---: |
| Extrapolation | Advanced Extrapolation |  |
| Phantom | Modular Flat Phantom |  |
| Distance Dipole Center - TSL | 10 mm | with Spacer |
| Zoom Scan Resolution | $\mathrm{dx}, \mathrm{dy}, \mathrm{dz}=5.0 \mathrm{~mm}$ |  |
| Frequency | $835 \mathrm{MHz} \pm 1 \mathrm{MHz}$ |  |

## Head TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Head TSL parameters | $22.0^{\circ} \mathrm{C}$ | 41.5 | $0.90 \mathrm{mho} / \mathrm{m}$ |
| Measured Head TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $40.7 \pm 6 \%$ | $0.92 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Head TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | --- | --- |

## SAR result with Head TSL

| SAR averaged over $1 \mathrm{~cm}^{\mathbf{3}}(1 \mathrm{~g})$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.39 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $9.36 \mathrm{~W} / \mathrm{kg} \pm 17.0 \%(\mathrm{k}=2)$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.55 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $6.10 \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathrm{k}=2)$ |

## Body TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 55.2 | $0.97 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $54.8 \pm 6 \%$ | $0.99 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $\ldots--$ | ---- |

## SAR result with Body TSL

| SAR averaged over $1 \mathrm{~cm}^{3}(1 \mathrm{~g})$ of Body TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.47 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $9.71 \mathrm{~W} / \mathrm{kg} \pm 17.0 \%(\mathrm{k}=2)$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.62 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $6.39 \mathrm{~W} / \mathrm{kg} \pm 16.5 \%(\mathrm{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $51.8 \Omega-2.9 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -29.5 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $47.4 \Omega-5.7 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -23.9 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.386 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |
| :--- | :---: |
| Manufactured on | July 22, 2011 |

## Appendix (Additional assessments outside the scope of SCS 0108)

## Measurement Conditions

DASY system configuration, as far as not given on page 1 and 3 .

| Phantom | SAM Head Phantom | For usage with cSAR3DV2-R/L |
| :--- | :---: | :--- |

## SAR result with SAM Head (Top)

| SAR averaged over $1 \mathrm{~cm}^{3}(1 \mathrm{~g})$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.40 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $9.41 \mathrm{~W} / \mathrm{kg} \pm \mathbf{1 7 . 5} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.58 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $6.21 \mathrm{~W} / \mathrm{kg} \pm 16.9 \%(\mathrm{k}=2)$ |

## SAR result with SAM Head (Mouth)

| SAR averaged over $1 \mathrm{~cm}^{3}(1 \mathrm{~g})$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.47 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{9 . 6 9 \mathrm { W } / \mathrm { kg } \pm 1 7 . 5 \% ( \mathbf { k } = 2 )}$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.64 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $6.45 \mathrm{~W} / \mathrm{kg} \pm 16.9 \%(\mathrm{k}=2)$ |

## SAR result with SAM Head (Neck)

| SAR averaged over $1 \mathrm{~cm}^{3}(1 \mathrm{~g})$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.35 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{9 . 2 2} \mathrm{~W} / \mathrm{kg} \pm 17.5 \%(\mathrm{k}=\mathbf{2})$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.59 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $6.25 \mathrm{~W} / \mathrm{kg} \pm 16.9 \%(\mathrm{k}=2)$ |

SAR result with SAM Head (Ear)

| SAR averaged over $1 \mathrm{~cm}^{3}(1 \mathrm{~g})$ of Head TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $2.03 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{7 . 9 6} \mathrm{~W} / \mathrm{kg} \pm \mathbf{1 7 . 5} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $10 \mathrm{~cm}^{3}(10 \mathrm{~g})$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $1.37 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $5.39 \mathrm{~W} / \mathrm{kg} \pm 16.9 \%(\mathrm{k}=2)$ |

## CALIBRATION CERTIFICATE

Object
Calibration procedures)

D1900V2 - SN:5d148

QA CAL-05.v9
Calibration procedure for dipole validation kits above 700 MHz

Calibration date:
February 07, 2018

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ} \mathrm{C}$ and humidity $<70 \%$.
Calibration Equipment used (M\&TE critical for calibration)

Issued: February 7, 2018
This calibration certificate shall not be reproduced except in full without written approval of the laboratory.

## Glossary:

TSL
ConvF
N/A
tissue simulating liquid sensitivity in TSL / NORM $x, y, z$
not applicable or not measured

Calibration is Performed According to the Following Standards:
a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak SpatialAveraged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz )", July 2016
c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz )", March 2010
d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz "

## Additional Documentation:

e) DASY4/5 System Handbook

## Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $\mathrm{k}=2$, which for a normal distribution corresponds to a coverage probability of approximately $95 \%$.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| DASY Version | DASY5 | V52.10.0 |
| :--- | :---: | :---: |
| Extrapolation | Advanced Extrapolation |  |
| Phantom | Modular Flat Phantom |  |
| Distance Dipole Center - TSL | 10 mm | with Spacer |
| Zoom Scan Resolution | $\mathrm{dx}, \mathrm{dy}, \mathrm{dz}=5 \mathrm{~mm}$ |  |
| Frequency | $1900 \mathrm{MHz} \pm 1 \mathrm{MHz}$ |  |

## Head TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Head TSL parameters | $22.0^{\circ} \mathrm{C}$ | 40.0 | $1.40 \mathrm{mho} / \mathrm{m}$ |
| Measured Head TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $40.7 \pm 6 \%$ | $1.39 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Head TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | $--\mathrm{-}$ | $-\mathrm{-}-$ |

## SAR result with Head TSL

| SAR averaged over $\mathbf{1} \mathrm{cm}^{\mathbf{3}} \mathbf{( 1 \mathrm { g } ) \text { of Head TSL }}$ | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $9.95 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to 1 W | $\mathbf{4 0 . 1} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 7 . 0} \%(\mathrm{k}=\mathbf{2})$ |

| SAR averaged over $\mathbf{1 0} \mathrm{cm}^{\mathbf{3}} \mathbf{( 1 0 ~ \mathbf { g } )}$ of Head TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $5.22 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Head TSL parameters | normalized to $\mathbf{1 W}$ | $\mathbf{2 1 . 0} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Body TSL parameters

The following parameters and calculations were applied.

|  | Temperature | Permittivity | Conductivity |
| :--- | :---: | :---: | :---: |
| Nominal Body TSL parameters | $22.0^{\circ} \mathrm{C}$ | 53.3 | $1.52 \mathrm{mho} / \mathrm{m}$ |
| Measured Body TSL parameters | $(22.0 \pm 0.2)^{\circ} \mathrm{C}$ | $55.2 \pm 6 \%$ | $1.48 \mathrm{mho} / \mathrm{m} \pm 6 \%$ |
| Body TSL temperature change during test | $<0.5^{\circ} \mathrm{C}$ | --- | ---- |

## SAR result with Body TSL

| SAR averaged over $\mathbf{1} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 \mathbf { g } )}$ of Body TSL | Condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $9.68 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to $\mathbf{1 W}$ | $\mathbf{3 9 . 6} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 7 . 0} \%(\mathbf{k}=\mathbf{2})$ |

| SAR averaged over $\left.\mathbf{1 0} \mathbf{c m}^{\mathbf{3}} \mathbf{( 1 0 ~ g}\right)$ of Body TSL | condition |  |
| :--- | :---: | :---: |
| SAR measured | 250 mW input power | $5.14 \mathrm{~W} / \mathrm{kg}$ |
| SAR for nominal Body TSL parameters | normalized to 1 W | $\mathbf{2 0 . 9} \mathbf{W} / \mathbf{k g} \pm \mathbf{1 6 . 5} \%(\mathbf{k}=\mathbf{2})$ |

## Appendix (Additional assessments outside the scope of SCS 0108)

Antenna Parameters with Head TSL

| Impedance, transformed to feed point | $52.1 \Omega+5.8 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -24.3 dB |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $47.8 \Omega+6.5 j \Omega$ |
| :--- | :---: |
| Return Loss | -23.1 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.199 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## Additional EUT Data

| Manufactured by | SPEAG |
| :--- | :---: |
| Manufactured on | March 11, 2011 |

DASY5 Validation Report for Head TSL
Date: 07.02.2018
Test Laboratory: SPEAG, Zurich, Switzerland
DUT: Dipole 1900 MHz ; Type: D1900V2; Serial: D1900V2 - SN:5d148
Communication System: UID 0 - CW; Frequency: 1900 MHz
Medium parameters used: $\mathrm{f}=1900 \mathrm{MHz} ; \sigma=1.39 \mathrm{~S} / \mathrm{m} ; \varepsilon_{\mathrm{r}}=40.7 ; \rho=1000 \mathrm{~kg} / \mathrm{m}^{3}$
Phantom section: Flat Section
Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)
DASY52 Configuration:

- Probe: EX3DV4 - SN7349; $\operatorname{ConvF}(8.18,8.18,8.18)$; Calibrated: 30.12.2017;
- Sensor-Surface: 1.4 mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn601; Calibrated: 26.10.2017
- Phantom: Flat Phantom 5.0 (front); Type: QD 000 P50 AA; Serial: 1001
- DASY52 52.10.0(1446); SEMCAD X 14.6.10(7417)

Dipole Calibration for Head Tissue/Pin=250 mW, d=10mm/Zoom Scan (7x7x7)/Cube 0:
Measurement grid: $\mathrm{dx}=5 \mathrm{~mm}, \mathrm{dy}=5 \mathrm{~mm}, \mathrm{dz}=5 \mathrm{~mm}$
Reference Value $=109.6 \mathrm{~V} / \mathrm{m}$; Power Drift $=-0.07 \mathrm{~dB}$
Peak SAR (extrapolated) $=18.5 \mathrm{~W} / \mathrm{kg}$
$\operatorname{SAR}(1 \mathrm{~g})=9.95 \mathrm{~W} / \mathrm{kg} ; \operatorname{SAR}(10 \mathrm{~g})=\mathbf{5 . 2 2} \mathbf{W} / \mathrm{kg}$
Maximum value of SAR (measured) $=15.3 \mathrm{~W} / \mathrm{kg}$

## Impedance Measurement Plot for Head TSL

## DASY5 Validation Report for Body TSL

Date: 07.02.2018
Test Laboratory: SPEAG, Zurich, Switzerland
DUT: Dipole 1900 MHz; Type: D1900V2; Serial: D1900V2 - SN:5d148

| Return Loss | -25.5 dB |

## Antenna Parameters with Head TSL at 5600 MHz

| Impedance, transformed to feed point | $51.9 \Omega+2.3 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -30.7 dB |

## Antenna Parameters with Head TSL at 5750 MHz

| Impedance, transformed to feed point | $55.6 \Omega-0.5 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -25.5 dB |

## Antenna Parameters with Body TSL at 5250 MHz

| Impedance, transformed to feed point | $46.9 \Omega-4.2 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -25.4 dB |

## Antenna Parameters with Body TSL at 5600 MHz

| Impedance, transformed to feed point | $50.2 \Omega+3.0 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -30.4 dB |

## Antenna Parameters with Body TSL at 5750 MHz

| Impedance, transformed to feed point | $53.4 \Omega+0.2 \mathrm{j} \Omega$ |
| :--- | :---: |
| Return Loss | -29.7 dB |

## General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.194 ns |
| :--- | :--- |

After long term use with 100 W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## APPENDIX D:SAR TISSUE SPECIFICATIONS

Measurement Procedure for Tissue verification:

1) The network analyzer and probe system was configured and calibrated.
2) The probe was immersed in the tissue. The tissue was placed in a nonmetallic container. Trapped air bubbles beneath the flange were minimized by placing the probe at a slight angle.
3) The complex admittance with respect to the probe aperture was measured
4) The complex relative permittivity $\varepsilon$ can be calculated from the below equation (Pournaropoulos and Misra):

$$
Y=\frac{j 2 \omega \varepsilon_{r} \varepsilon_{0}}{[\ln (b / a)]^{2}} \int_{a}^{b} \int_{a}^{b} \int_{0}^{\pi} \cos \phi^{\prime} \frac{\exp \left[-j \omega r\left(\mu_{0} \varepsilon_{r}^{\prime} \varepsilon_{0}\right)^{1 / 2}\right]}{r} d \phi^{\prime} d \rho^{\prime} d \rho
$$

where $Y$ is the admittance of the probe in contact with the sample, the primed and unprimed coordinates refer to source and observation points, respectively, $r^{2}=\rho^{2}+\rho^{\prime 2}-2 \rho \rho^{\prime} \cos \phi^{\prime}, \omega$ is the angular frequency, and $j=\sqrt{-1}$.

## APPENDIX E: SAR SYSTEM VALIDATION

Per FCC KDB Publication 865664 D02v01r02, SAR system validation status should be documented to confirm measurement accuracy. The SAR systems (including SAR probes, system components and software versions) used for this device were validated against its performance specifications prior to the SAR measurements. Reference dipoles were used with the required tissue- equivalent media for system validation, according to the procedures outlined in FCC KDB Publication 865664 D01v01r04 and IEEE 1528-2013. Since SAR probe calibrations are frequency dependent, each probe calibration point was validated at a frequency within the valid frequency range of the probe calibration point, using the system that normally operates with the probe for routine SAR measurements and according to the required tissue-equivalent media.

A tabulated summary of the system validation status including the validation date(s), measurement frequencies, SAR probes and tissue dielectric parameters has been included.

NOTE: While the probes have been calibrated for both CW and modulated signals, all measurements were performed using communication systems calibrated for CW signals only. Modulations in the table above represent test configurations for which the measurement system has been validated per FCC KDB Publication 865664 D01v01r04 for scenarios when CW probe calibrations are used with other signal types. SAR systems were validated for modulated signals with a periodic duty cycle, such as GMSK, or with a high peak to average ratio ( $>5$ dB), such as OFDM according to FCC KDB Publication 865664 D01v01r04.

## APPENDIX G: POWER REDUCTION VERIFICATION

Per the May 2017 TCBC Workshop Notes, demonstration of proper functioning of the power reduction mechanisms is required to support the corresponding SAR configurations. The verification process was divided into two parts: (1) evaluation of output power levels for individual or multiple triggering mechanisms and (2) evaluation of the triggering distances for proximity-based sensors.

### 1.1 Power Verification Procedure

The power verification was performed according to the following procedure:

1. A base station simulator was used to establish a conducted RF connection and the output power was monitored. The power measurements were confirmed to be within expected tolerances for all states before and after a power reduction mechanism was triggered.
2. Step 1 was repeated for all relevant modes and frequency bands for the mechanism being investigated.
3. Steps 1 and 2 were repeated for all individual power reduction mechanisms and combinations thereof. For the combination cases, one mechanism was switched to a 'triggered' state at a time; powers were confirmed to be within tolerances after each additional mechanism was activated.

### 1.2 Distance Verification Procedure

The distance verification procedure was performed according to the following procedure:

1. A base station simulator was used to establish an RF connection and to monitor the power levels. The device being tested was placed below the relevant section of the phantom with the relevant side or edge of the device facing toward the phantom.
2. The device was moved toward and away from the phantom to determine the distance at which the mechanism triggers and the output power is reduced, per KDB Publication 616217 D04v01r02 and FCC Guidance. Each applicable test position was evaluated. The distances were confirmed to be the same or larger (more conservative) than the minimum distances provided by the manufacturer.
3. Steps 1 and 2 were repeated for low, mid, and high bands, as appropriate (see note below Table G-2 for more details).
4. Steps 1 through 3 were repeated for all distance-based power reduction mechanisms.

## APPENDIX H: DOWNLINK LTE CA RF CONDUCTED POWERS

### 1.1 LTE Downlink Only Carrier Aggregation Test Reduction Methodology

SAR test exclusion for LTE downlink Carrier Aggregation is determined by power measurements according to the number of component carriers (CCs) supported by the product implementation. Per FCC Guidance, the following test reduction methodology was applied to determine the combinations required for conducted power measurements.

LTE DLCA Test Reduction Methodology:

- The supported combinations were arranged by the number of component carriers in columns.
- Any limitations on the PCC or SCC for each combination were identified alongside the combination (e.g. CA_2A-2A-4A-12A, but B12 can only be configured as a SCC).
- Power measurements were performed for "supersets" (LTE CA combinations with multiple components carriers) and any "subsets" (LTE CA combinations with fewer component carriers) that were not completely covered by the supersets.
- Only subsets that have the exact same components as a superset were excluded for measurement.
- When there were certain restrictions on component carriers that existed in the superset that were not applied for the subset, the subset configuration was additionally evaluated.
- Both inter-band and intra-band downlink carrier aggregation scenarios were considered.
- Downlink CA combinations for SISO and $4 \times 4$ Downlink MIMO operations were measured independently, per May 2017 TCBC Workshop notes.

Table 1 - Example of Exclusion Table for SISO Configurations

### 1.2 LTE Downlink Only Carrier Aggregation Test Selection and Setup

SAR test exclusion for LTE downlink Carrier Aggregation is determined by power measurements according to the number component carriers (CCs) supported by the product implementation. For those configurations required by FCC Guidance, conducted power measurements with LTE Carrier Aggregation (CA) (downlink only) active are made in accordance to KDB Publication 941225 D05Av01r02. The RRC connection is only handled by one cell, the primary component carrier (PCC) for downlink and uplink communications. After making a data connection to the PCC, the UE device adds secondary component carrier(s) (SCC) on the downlink only. All uplink communications and acknowledgements remain identical to specifications when downlink carrier aggregation is inactive on the PCC. Additional conducted output powers are measured with the downlink carrier aggregation active for the configuration with highest measured maximum conducted power with downlink carrier aggregation inactive measured among the channel bandwidth, modulation, and RB combinations in each frequency band.

Per FCC KDB Publication 941225 D05Av01r02, no SAR measurements are required for carrier aggregation configurations when the average output power with downlink only carrier aggregation active is not more than 0.25 dB higher than the average output power with downlink only carrier aggregation inactive.

LTE Downlink Carrier Aggregaton was fully addressed in the original filing. Per FCC Guidance, only combiantions that were impacted with respect to this permissive change were additionally evaluated. Refer RF Exposure Technical Report S/N 1M1804040063-01.A3L for the excluded combinations which have been addressed per KDB 941225 D05A and April 2018 TCBC Workshop guidance.

General PCC and SCC configuration selection procedure

- PCC uplink channel, channel bandwidth, modulation and RB configurations were selected based on section C)3)b)ii) of KBD 941225 D05 V01r02. The downlink PCC channel was paired with the selected PCC uplink channel according to normal configurations without carrier aggregation.
- To maximize aggregated bandwidth, highest channel bandwidth available for that CA combination was selected for SCC. For inter-band CA, the SCC downlink channels were selected near the middle of their transmission bands. For contiguous intra-band CA, the downlink channel spacing between the component carriers was set to multiple of 300 kHz less than the nominal channel spacing defined in section 5.4.1A of 3GPP TS 36.521. For non-contiguous intra-band CA, the downlink channel spacing between the component carriers was set to be larger than the nominal channel spacing and provided maximum separation between the component carriers.
- All selected PCC and SCC(s) remained fully within the uplink/downlink transmission band of the respective component carrier.
- When a device supports LTE capabilities with overlapping transmission frequency ranges, the standalone powers from the band with a larger transmission frequency range can be used to select measurement configurations for the band with the fully covered transmission frequency range.

### 1.4 4x4 Downlink MIMO RF Conduction Powers

This device supports downlink $4 \times 4$ MIMO operations for some LTE bands. Uplink transmission is limited to a single output stream. When carrier aggregation was applicable, the general test selection and setup procedures described in Section 1.2 were applied.

Per May 2017 TCB Workshop Notes, SAR for 4x4 DL MIMO was not needed since the maximum average output power in $4 \times 4$ DL MIMO mode was not more than 0.25 dB higher than the maximum output power with $4 \times 4$ DL MIMO inactive. Additionally, SAR for $4 \times 4$ MIMO Downlink Carrier Aggregation was not needed since the maximum average output power in $4 \times 4$ MIMO Downlink Carrier Aggregation mode was not more than 0.25 dB higher than the maximum output power with $4 \times 4$ MIMO Downlink and downlink carrier aggregation inactive.

### 1.5 LAA Downlink Carrier Aggregation

This device supports LAA with downlink carrier aggregation only. It uses carrier aggregation in the downlink to combine LTE in the unlicensed spectrum (i.e. LTE Band 46) with LTE in the licensed band (served as PCC). All uplink communications and acknowledgements on the PCC remain identical to specifications when downlink carrier aggregation is inactive. Due to the wide downlink bandwidth, each Band 46 sub-band, represented by subscripts A, B, C, and D, was evaluated independently. The general test selection and setup procedures described in Section 1.2 were applied.

Per FCC KDB Publication 941225 D05Av01r02, no SAR measurements are required for carrier aggregation configurations when the average output power with downlink only carrier aggregation active is not more than 0.25 dB higher than the average output power with downlink only carrier aggregation inactive.

[^0]:    This calibration certificate shall not be reproduced except in full without written approval of the laboratory.

[^1]:    ${ }^{\text {c }}$ Frequency validity above 300 MHz of $\pm 100 \mathrm{MHz}$ only applies for DASY v4.4 and higher (see Page 2), else it is restricted to $\pm 50 \mathrm{MHz}$. The uncerdainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is $\pm 10,25,40,50$ and 70 MHz for ConvF assessments at $30,64,128,150$ and 220 MHz respectively. Above 5 GHz frequency validity can be extended to $\pm 110 \mathrm{MHz}$.
    ${ }^{F}$ At frequencies below 3 GHz , the validity of tissue parameters ( $\varepsilon$ and $\sigma$ ) can be relaxed to $\pm 10 \%$ if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz , the validity of tissue parameters ( $\varepsilon$ and $\sigma$ ) is restricted to $\pm 5 \%$. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
    ${ }^{\mathrm{G}}$ Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than $\pm 1 \%$ for frequencies below 3 GHz and below $\pm 2 \%$ for frequencies between $3-6 \mathrm{GHz}$ at any distance larger than half the probe tip diameter from the boundary.

[^2]:    ${ }^{\text {c }}$ Frequency validity above 300 MHz of $\pm 100 \mathrm{MHz}$ only applies for DASY v4.4 and higher (see Page 2), else it is restricted to $\pm 50 \mathrm{MHz}$. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is $\pm 10,25,40,50$ and 70 MHz for ConvF assessments at $30,64,128,150$ and 220 MHz respectively. Above 5 GHz frequency validity can be extended to $\pm 110 \mathrm{MHz}$.
    ${ }^{F}$ At frequencies below 3 GHz , the validity of tissue parameters ( $\varepsilon$ and $\sigma$ ) can be relaxed to $\pm 10 \%$ if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz , the validity of tissue parameters ( s and $\sigma$ ) is restricted to $\pm 5 \%$. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
    ${ }^{6}$ Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than $\pm 1 \%$ for frequencies below 3 GHz and below $\pm 2 \%$ for frequencies between $3-6 \mathrm{GHz}$ at any distance larger than half the probe tip diameter from the boundary.

[^3]:    ${ }^{\text {A }}$ The uncertainties of Norm $X, Y, Z$ do not affect the $E^{2}$-field uncertainty inside TSL (see Pages 5 and 6).
    ${ }^{9}$ Numerical linearization parameter: uncertainty not required.
    ${ }^{E}$ Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.
