

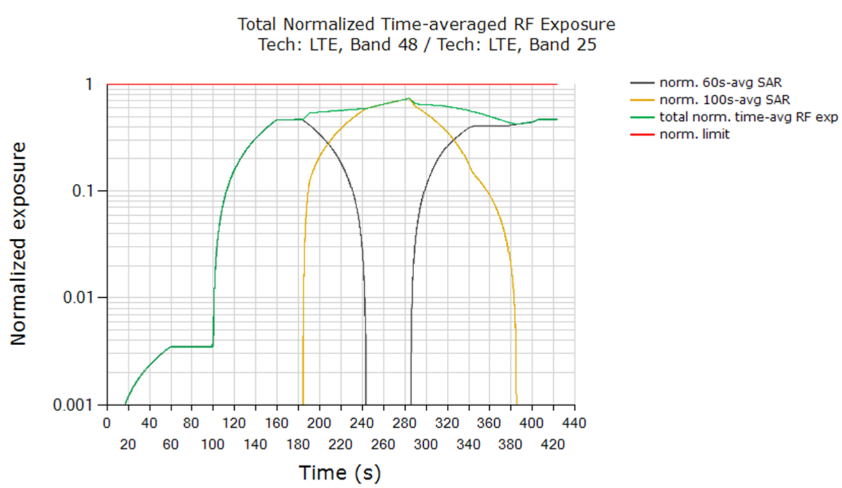
Note: As per the manufacturer, *Reserve_power_margin* = 3dB. Based on Table 8-1, EFS *Plimit* = 21.4 dBm (*Pmax* = 20.5 dBm) for LTE B48 DSI = 3 (60s window), and EFS *Plimit* = 18.0 dBm for LTE B25 DSI = 3 (100s window).The conducted power plot shows expected transitions in Tx power at ~185s (60s-to-100s transition) and at ~290s (100s-to-60s transition) in order to maintain total time-averaged RF exposure compliance across time windows, as show in next plot.

Plot 2: All the conducted Tx power measurement results were converted into time-averaged normalized SAR values using Equation (7a), (7b) and (7c), and plotted below to demonstrate that the time-averaged normalized SAR versus time does not exceed the FCC limit of 1 unit. Equation (7a) is used to convert the Tx power of device to obtain 60s-averaged normalized SAR in LTE B48 as shown in black curve. Similarly, equation (7b) is used to obtain 100s-averaged normalized SAR in LTE B25 as shown in orange curve. Equation (7c) is used to obtain total time-averaged normalized SAR as shown in green curve (i.e., sum of black and orange curves).

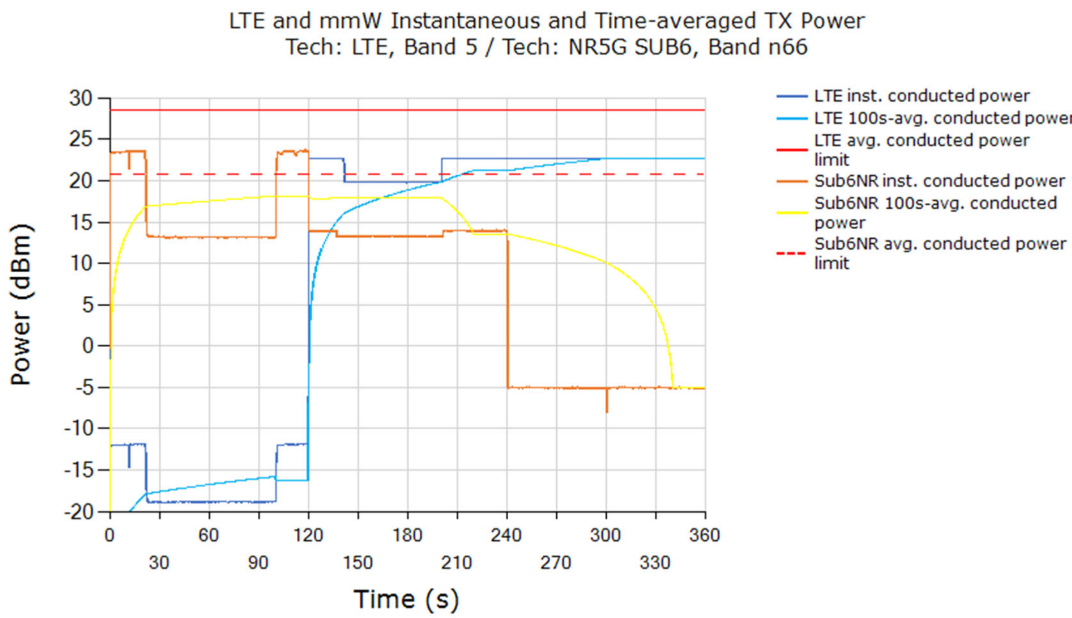


| | (W/kg) |
|---|---|
| FCC normalized total exposure limit | 1.0 |
| Max time averaged normalized SAR (green curve) | 0.735 |
| Validated | |

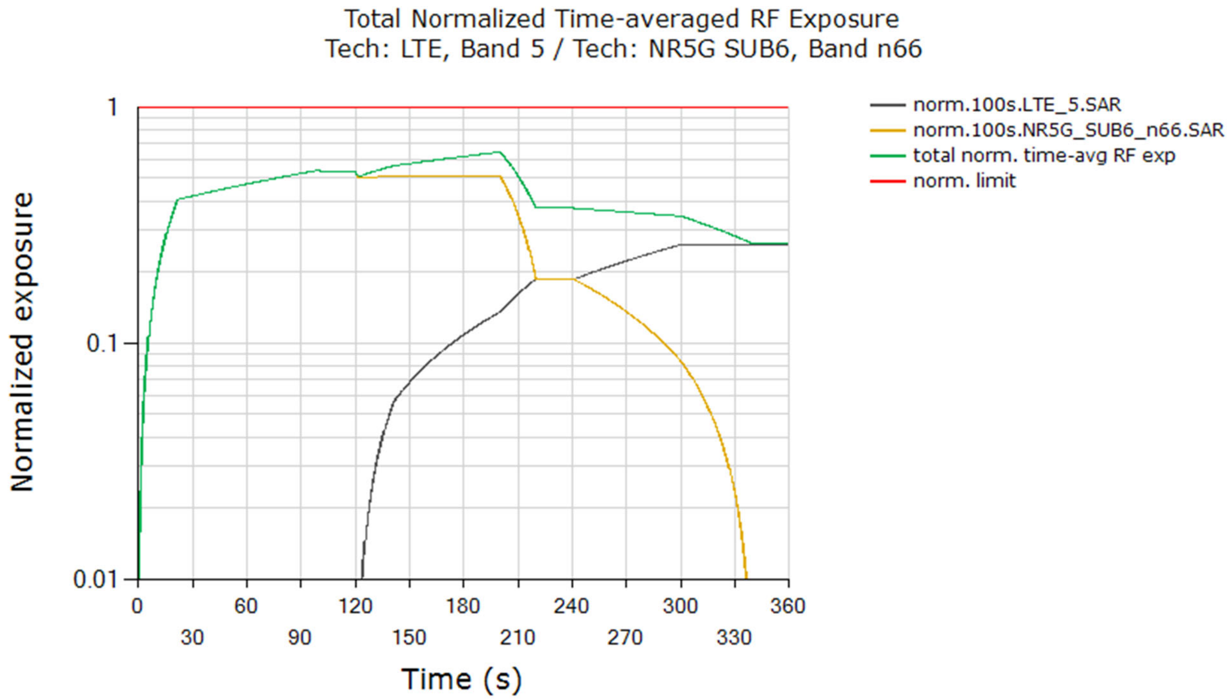
Plot Notes: Maximum power is requested by callbox for the entire duration of the test, with tech/band switches from 60s-to-100s window at ~185 time stamp, and from 100s-to-60s window at ~290s time stamp. Smart Transmit controls the Tx power during these time-window switches to ensure total time-averaged RF exposure, i.e., sum of black and orange curves given by equation (7c), is always compliant. In time-window switch test, at all times the total time-averaged normalized RF exposure (green curve) should not exceed normalized *SAR_design_target* + 1dB device uncertainty. In this test, with a maximum normalized SAR of 0.735 being ≤ 0.79 (= 1.0/1.6 + 1dB device uncertainty), the above test result validated the continuity of power limiting in time-window switch scenario.

## 9.6 Switch in SAR exposure test results

This test was conducted with callbox requesting maximum power, and with the EUT in LTE B5 + Sub6 NR Band n66 call. Following procedure detailed in Section 4.3.7 and Appendix E.2, and using the measurement setup shown in Figure 6-1(c) since LTE and Sub6 NR are sharing the same antenna port, the SAR exposure switch measurement is performed with the EUT in various SAR exposure scenarios, i.e., in $SAR_{sub6NR}$ only scenario (t =0s ~120s), $SAR_{su6NR}$ + $SAR_{LTE}$ scenario (t =120s ~ 240s) and $SAR_{LTE}$ only scenario (t > 240s).



Plot 2: All the conducted Tx power measurement results were converted into time-averaged normalized SAR values using Equation (7a), (7b) and (7c), and plotted below to demonstrate that the time-averaged normalized SAR versus time does not exceed the FCC limit of 1 unit. Equation (7a) is used to convert the LTE Tx power of device to obtain 100s-averaged normalized SAR in LTE B5 as shown in black curve. Similarly, equation (7b) is used to obtain 100s-averaged normalized SAR in Sub6 NR n66 as shown in orange curve. Equation (7c) is used to obtain total time-averaged normalized SAR as shown in green curve (i.e., sum of black and orange curves).



| | (W/kg) |
|---|---|
| FCC normalized total exposure limit | 1.0 |
| Max time averaged normalized SAR (green curve) | 0.646 |
| Validated | |

Plot Notes: Device starts predominantly in Sub6 NR SAR exposure scenario between 0s and 120s, and in LTE SAR + Sub6 NR SAR exposure scenario between 120s and 240s, and in predominantly in LTE SAR exposure scenario after t=240s. Here, Smart Transmit allocates a maximum of 75% of exposure margin (based on 3dB reserve margin setting) for Sub6 NR. This corresponds to a normalized 1gSAR exposure value = 75% * 1.110 W/kg measured SAR at Sub6 NR *Plimit* / 1.6W/kg limit = 0.520 ± 1dB device related uncertainty (see orange curve between 0s~120s). For predominantly LTE SAR exposure scenario, maximum normalized 1gSAR exposure should correspond to 100% exposure margin = 0.782 W/kg measured SAR at LTE *Plimit* / 1.6W/kg limit = 0.489 ± 1dB device related uncertainty (see black curve after t = 240s). Additionally, in SAR exposure switch test, at all times the total time-averaged normalized RF exposure (green curve) should not exceed normalized *SAR_design_target* + 1dB device uncertainty. In this test, with a maximum normalized SAR of 0.646 being ≤ 0.79 (= 1.0/1.6 + 1dB device uncertainty), the above test result validated the continuity of power limiting in SAR exposure switch scenario.

# 10 TEST CONFIGURATIONS (FREQ > 6 GHZ)

## 10.1 LTE + mmW NR transmission

Based on the selection criteria described in Section 4.2, the selections for LTE and mmW NR validation test are listed in Table 10-1. The radio configurations used in this test are listed in Table 10-2.

**Table 10-1**
**Selections for LTE + mmW NR validation measurements**

| Transmission Scenario | Test | Technology and Band | mmW Beam |
|---|---|---|---|
| Time-varying Tx power test | 1. Cond. & Rad. Power meas.<br>2. PD meas. | LTE Band 2 and n261 | Beam ID 19 |
| | | LTE Band 2 and n260 | Beam ID 26 |
| Switch in SAR vs. PD | 1. Cond. & Rad. Power meas. | LTE Band 2 and n261 | Beam ID 19 |
| | | LTE Band 2 and n260 | Beam ID 26 |
| Beam switch test | 1. Cond. & Rad. Power meas. | LTE Band 2 and n261 | Beam ID 19 to Beam ID 1 |
| | | LTE Band 2 and n260 | Beam ID 26 to Beam ID 1 |

**Table 10-2**
**Test configuration for LTE + mmW NR validation**

| Tech | Band | Antenna | DSI | Channel | Freq (MHz) | RB/RB Offset/Bandwidth (MHz) | Mode | UL Duty Cycle |
|---|---|---|---|---|---|---|---|---|
| LTE | 2 | A | 3 | 18900 | 1880 | 1/0/20 MHz BW | QPSK | 100% |
| mmW NR | n261 | K | - | 2071821 | 27559.32 | 66/0/100 MHz BW | CP-OFDM, QPSK | 75.6%* |
| | n260 | K | - | 2254147 | 38498.88 | 66/0/100 MHz BW | CP-OFDM, QPSK | 75.6%* |

## 10.2 mmW NR radiated power test results

To demonstrate the compliance, the conducted Tx power of LTE 2 in DSI = 3 is converted to 1gSAR exposure by applying the corresponding worst-case 1g SAR value at $P_{limit}$ as reported in Part 1 report and listed in Table 8-2 of this report.

Similarly, following Step 4 in Section 5.3.1, radiated Tx power of mmW Band n261 and n260 for the beams tested is converted by applying the corresponding measured worst-case 4cm$^2$PD values, and listed in below Table 10-3. Qualcomm Smart Transmit feature operates based on time-averaged Tx power reported on a per symbol basis, which is independent of modulation, channel and bandwidth (RBs), therefore the worst-case 4cm$^2$PD was conducted with the EUT in FTM mode, with CW modulation and 100% duty cycle. cDASY6 system verification for power density measurement is provided in Section 12, and the associated SPEAG certificates are attached in Appendix E.

Both the worst-case 1gSAR and 4cm$^2$PD values used in this section are listed in Table 10-3. The measured EIRP at *input.power.limit* for the beams tested in this section are also listed in Table 10-3.

**Table 10-3**
**Worst-case 1gSAR, 4cm² avg. PD and EIRP measured at *input.power.limit* for the selected configurations**

| Tech | Band | Antenna | Beam ID | input.power.limit (dBm) | Measured psPD at input.power.limit | | Measured EIRP at input.power.limit (dBm) |
|---|---|---|---|---|---|---|---|
| | | | | | 4cm² psPD (W/m²) | Test Position | |
| mmW NR | n261 | K | 19 | 4.1 | 4.23 | Left | 14.77 |
| | | K | 1 | 9.3 | 4.05 | Left | 11.21 |
| mmW NR | n260 | K | 26 | 4.6 | 4.67 | Left | 17.49 |
| | | K | 1 | 8.5** | 5.01 | Left | 10.86 |

| Tech | Band | Antenna | DSI | Measured Plimit (dBm) | Measured 1g SAR at Plimit | |
|---|---|---|---|---|---|---|
| | | | | | 1g SAR (W/kg) | Test Position |
| LTE | 2 | A | 3 | 18.58 | 1.04 | Bottom |

*The *input.power.limit* for n260 beam 1 is 9.9 dBm. However, the maximum input power of SDX55M for n261 CP-OFDM modulation is 8.5dBm for the test configuration used, thus, the *input.power.limit* was adjusted to 8.5 dBm in the static PD measurement via FTM for n260 beam 1 to obtain the maximum PD exposure for CP-OFDM modulation.

The 4cm² psPD distributions for the highest PD value per band, as listed in Table 10-3, are plotted below.

**Figure 10-1**
**4cm² psPD distribution measured at *input.power.limit* of 4.1 dBm on the left surface for n261 beam 19**

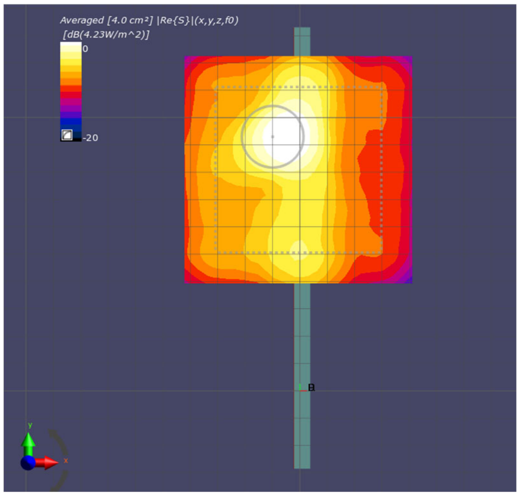


***Figure 10-2***
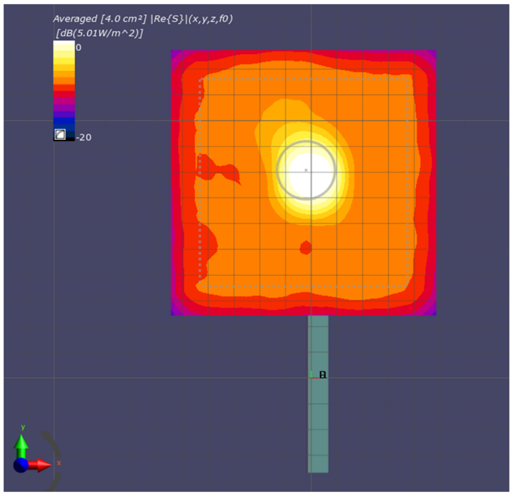
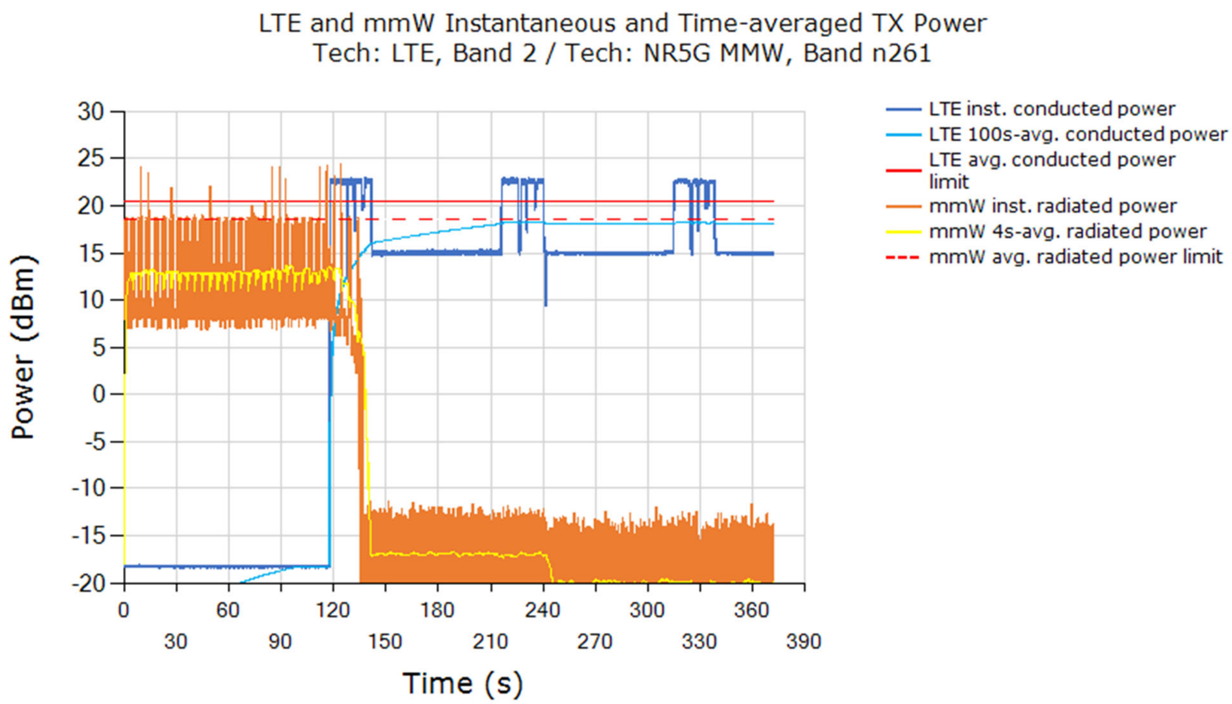
**4cm² psPD distribution measured at *input.power.limit* of 8.5 dBm on the left surface for n260 beam 1**



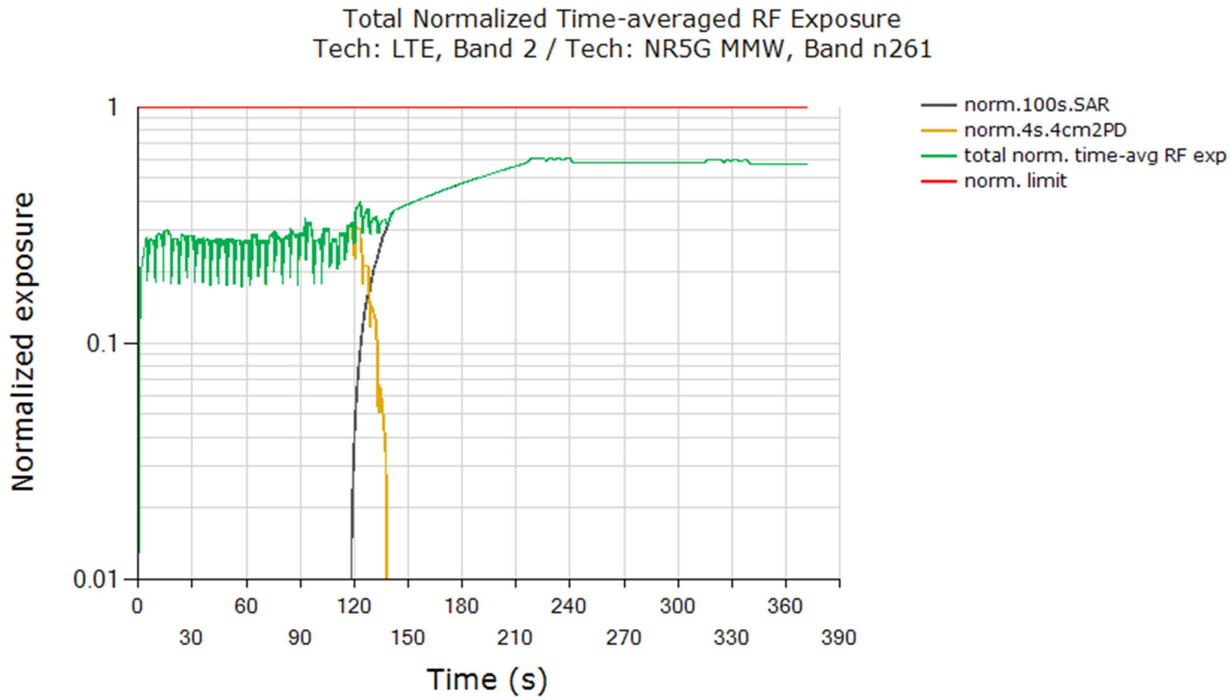
## 11.1 Maximum Tx power test results for n261

This test was measured with LTE 2 and mmW Band n261 Beam ID 19, by following the detailed test procedure described in Section 5.3.1.

Instantaneous and 100s-averaged conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged conducted LTE Tx power limit and time-averaged radiated mmW Tx power limit:



Above time-averaged conducted Tx power for LTE 2 and radiated Tx power for mmW NR n261 beam 19 are converted into time-averaged 1gSAR and time-averaged 4cm$^2$PD using Equation (2a) and (2b), which are divided by FCC 1gSAR limit of 1.6 W/kg and 4cm$^2$PD limit of 10 W/m$^2$, respectively, to obtain normalized exposures versus time. Below plot shows (a) normalized time-averaged 1gSAR versus time, (b) normalized time-averaged 4cm2-avg.PD versus time, (c) sum of normalized time-averaged 1gSAR and normalized time-averaged 4cm$^2$-avg.PD:



| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.607 |
| Validated | |

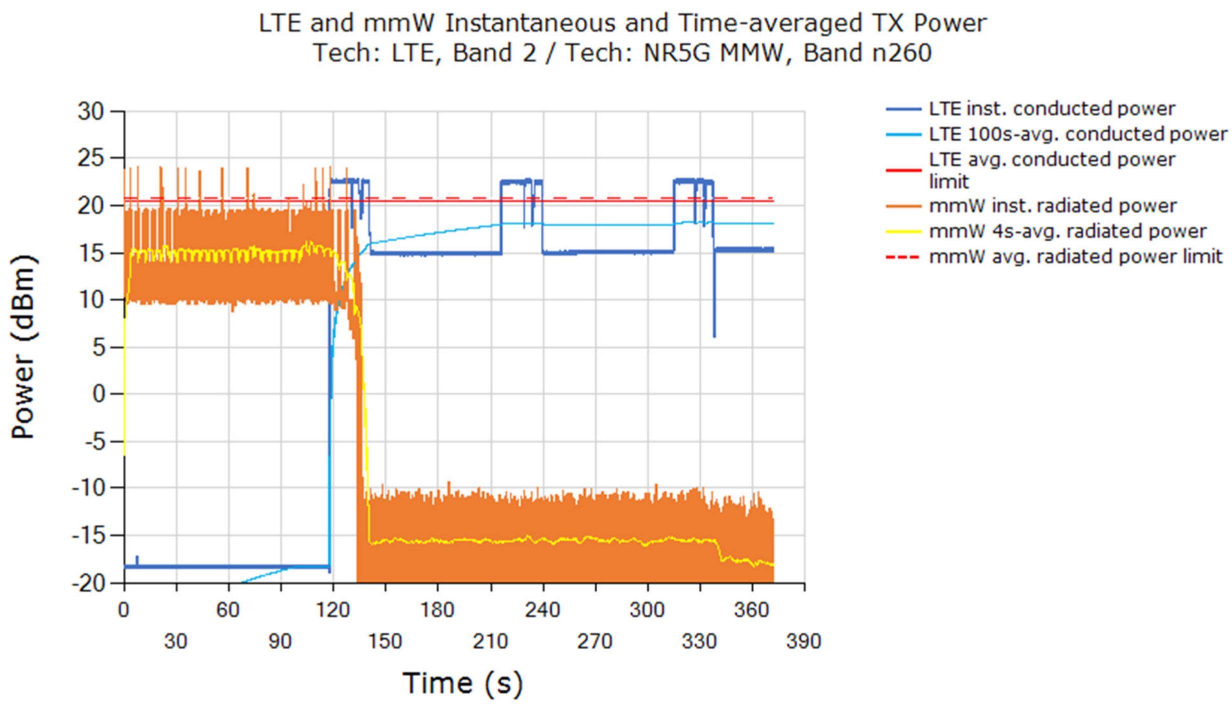
Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on the 3dB reserve setting in Part 1 report). From Table 10-3, this corresponds to a normalized $4cm^2$PD exposure value for Beam ID 19 of (75% * 4.23 $W/m^2$)/(10 $W/m^2$) = 31.7% ± 2.1dB device related uncertainty (see green/orange curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually. Towards the end of test, LTE is the dominant contributor towards RF exposure, i.e., corresponding normalized 1gSAR exposure value of (100% * 1.04 W/kg)/(1.6 W/kg) = 65.0% ± 1dB design related uncertainty (see black curve approaching this level towards end of the test).

As can be seen, the power limiting enforcement is effective and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

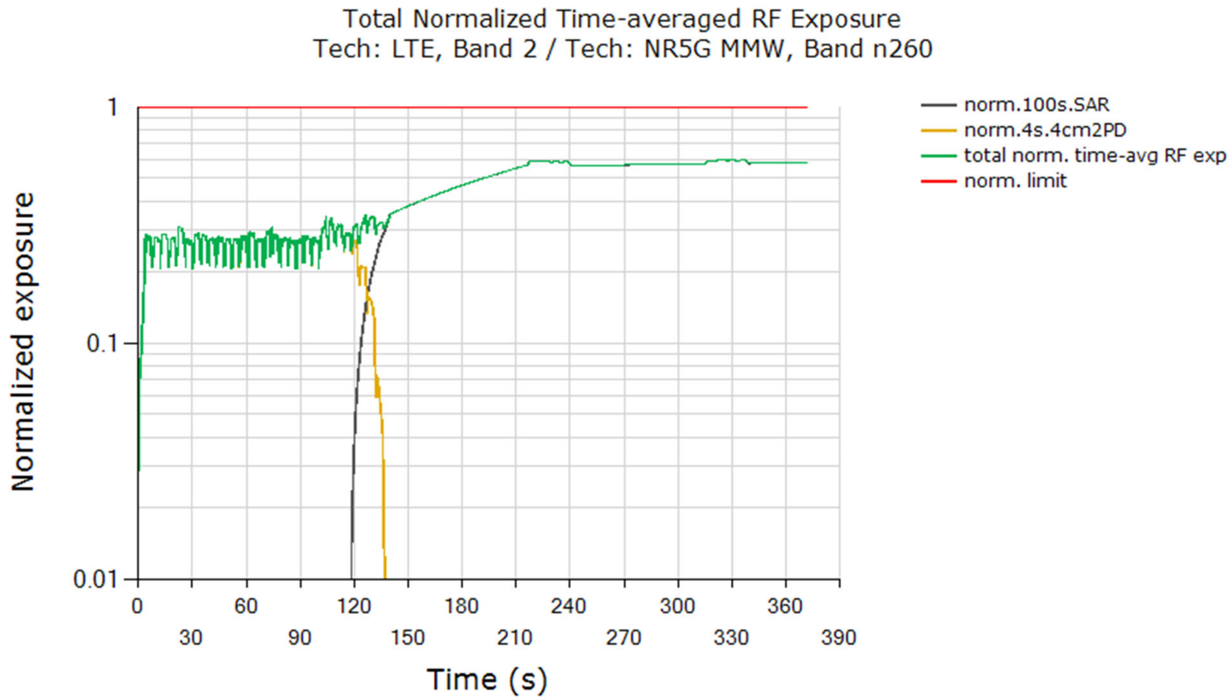
## 11.2 Maximum Tx power test results for n260

This test was measured with LTE 2 and mmW Band n260 Beam ID 26, by following the detailed test procedure described in Section 5.3.1.

Instantaneous and 100s-averaged conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged conducted LTE Tx power limit and time-averaged radiated mmW Tx power limit:



Above time-averaged conducted Tx power for LTE 2 and radiated Tx power for mmW NR n260 beam 26 are converted into time-averaged 1gSAR and time-averaged 4cm$^2$PD using Equation (2a) and (2b), which are divided by FCC 1gSAR limit of 1.6 W/kg and 4cm$^2$PD limit of 10 W/m$^2$, respectively, to obtain normalized exposures versus time. Below plot shows (a) normalized time-averaged 1gSAR versus time, (b) normalized time-averaged 4cm2-avg.PD versus time, (c) sum of normalized time-averaged 1gSAR and normalized time-averaged 4cm$^2$-avg.PD:



| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.598 |
| Validated | |

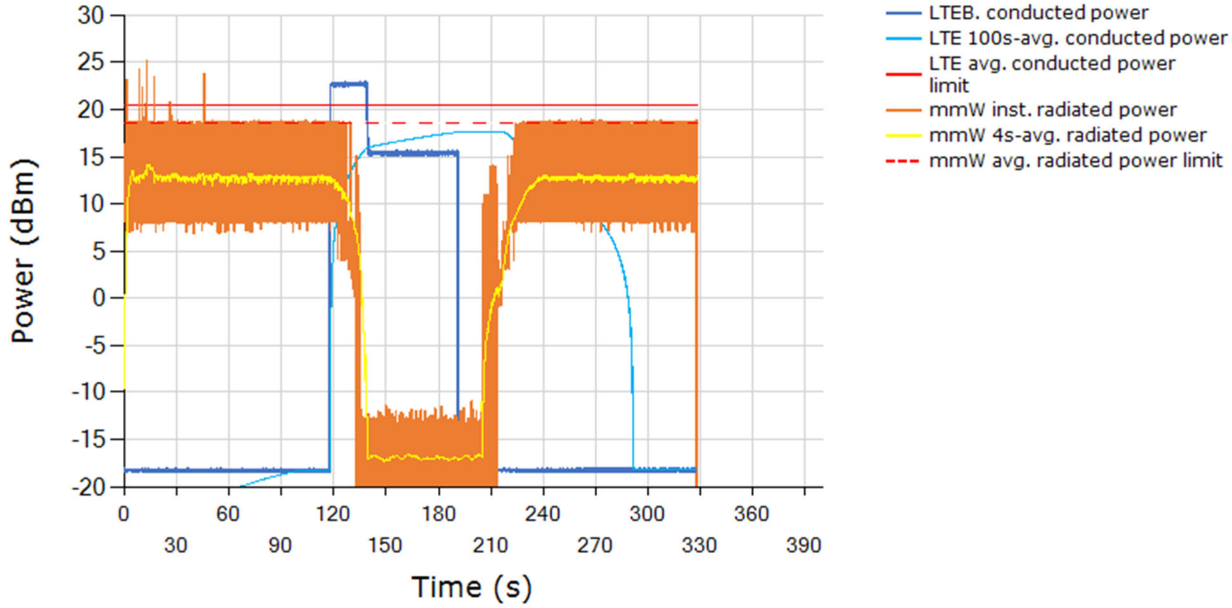
Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on the 3dB reserve setting in Part 1 report). From Table 10-3, this corresponds to a normalized 4cm$^2$PD exposure value for Beam ID 26 of (75% * 4.67 W/m$^2$)/(10 W/m$^2$) = 35.0% ± 2.1dB device related uncertainty (see green/orange curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually. Towards the end of test, LTE is the dominant contributor towards RF exposure, i.e., corresponding normalized 1gSAR exposure value of (100% * 1.04 W/kg)/(1.6 W/kg) = 65.0% ± 1dB design related uncertainty (see black curve approaching this level towards end of the test).

As can be seen, the power limiting enforcement is effective and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

## 11.3 Switch in SAR vs. PD exposure test results for n261

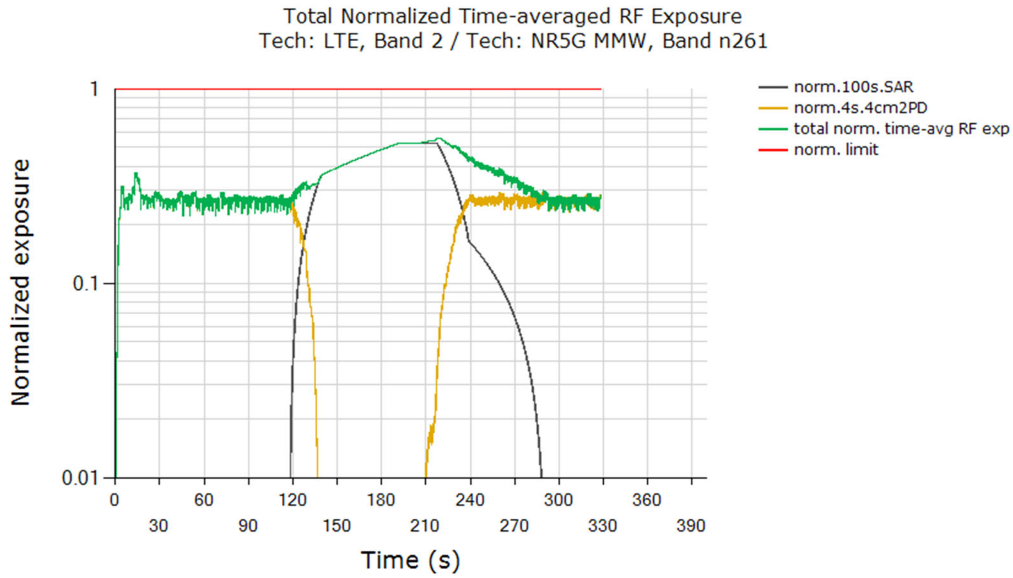
This test was measured with LTE Band 2 (DSI =3) and mmW Band n261 Beam ID 19 by following the detailed test procedure is described in Section 5.3.2.

Instantaneous and 100s-averaged conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged conducted LTE Tx power limit and time-averaged radiated mmW Tx power limit:



From the above plot, it is predominantly instantaneous PD exposure between 0s ~ 120s, it is instantaneous SAR+PD exposure between 120s ~ 140s, it is predominantly instantaneous SAR exposure between 140s ~ 200s, and above 200s, it is predominantly instantaneous PD exposure.

Normalized time-averaged exposures for LTE (1gSAR) and mmW ($4cm^2$PD), as well as total normalized time-averaged exposure versus time:



| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.562 |
| Validated | |

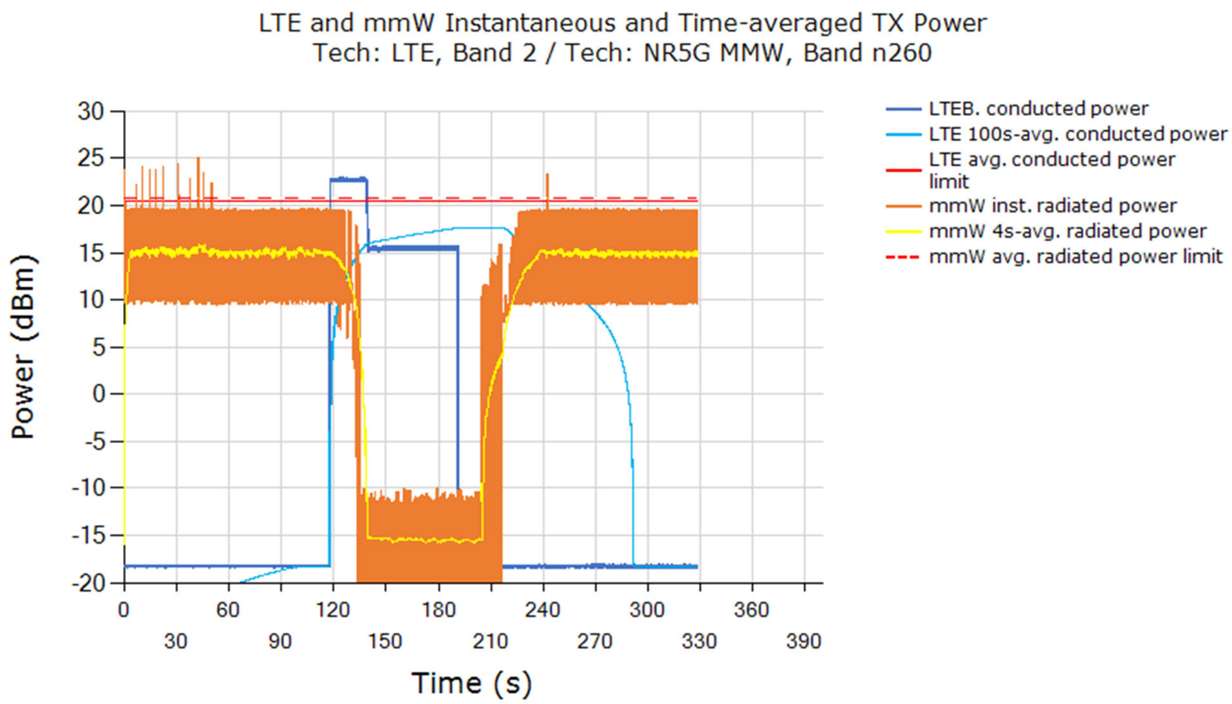
Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). From Table 10-3, this corresponds to a normalized $4cm^2$PD exposure value for Beam ID 19 of (75% * 4.23 $W/m^2$)/(10 $W/m^2$) = 31.7% ± 2.1dB device related uncertainty (see orange/green curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually (orange curve for mmW exposure goes down while black curve for LTE exposure goes up). At ~200s time mark, LTE is set to all-down bits, which results in mmW getting back RF margin slowly as seen by gradual increase in mmW exposure (orange curve for mmW exposure goes up while black curve for LTE exposure goes down). The calculated maximum RF exposure from LTE corresponds to normalized 1gSAR exposure value of (100% * 1.04 W/kg)/(1.6 W/kg) = 65.0% ± 1dB design related uncertainty (note that this level will be achieved by green and black curves if LTE remains in all-up bits for longer time duration which was already demonstrated in maximum Tx power test in Section 11.1). Total normalized time-averaged exposure (green curve) for this test should be within the calculated range between 31.7% ± 2.1dB device related uncertainty (only PD exposure) and 65.0% ± 1dB design related uncertainty (only SAR exposure).

As can be seen, the power limiting enforcement is effective during transmission when SAR and PD exposures are switched, and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

## 11.4 Switch in SAR vs. PD exposure test results for n260

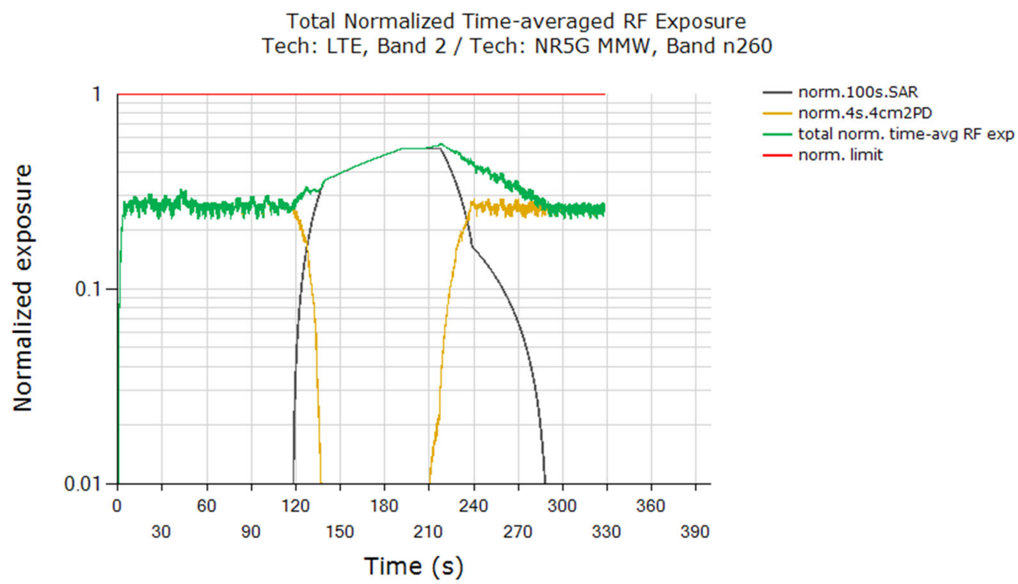
This test was measured with LTE Band 2 (DSI =3) and mmW Band n260 Beam ID 26, by following the detailed test procedure is described in Section 5.3.2.

Instantaneous and 100s-averaged conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged conducted LTE Tx power limit and time-averaged radiated mmW Tx power limit:



From the above plot, it is predominantly instantaneous PD exposure between 0s ~ 120s, it is instantaneous SAR+PD exposure between 120s ~ 140s, it is predominantly instantaneous SAR exposure between 140s ~ 200s, and above 200s, it is predominantly instantaneous PD exposure

Normalized time-averaged exposures for LTE (1gSAR) and mmW (4cm$^2$PD), as well as total normalized time-averaged exposure versus time:



| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.560 |
| Validated | |

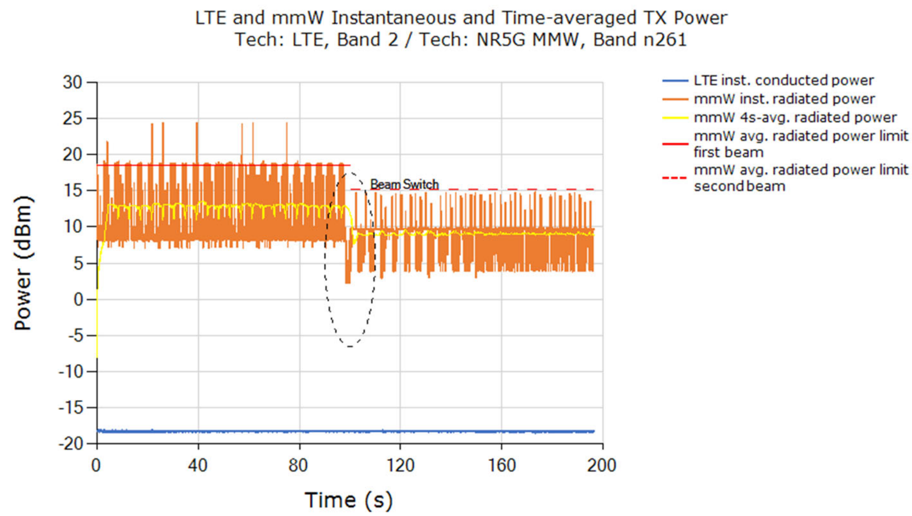
Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). From Table 10-3, this corresponds to a normalized $4cm^2$PD exposure value for Beam ID 26 of (75% * 4.67 $W/m^2$)/(10 $W/m^2$) = 35.0% ± 2.1dB device related uncertainty (see orange/green curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually (orange curve for mmW exposure goes down while black curve for LTE exposure goes up). At ~200s time mark, LTE is set to all-down bits, which results in mmW getting back RF margin slowly as seen by gradual increase in mmW exposure (orange curve for mmW exposure goes up while black curve for LTE exposure goes down). The calculated maximum RF exposure from LTE corresponds to normalized 1gSAR exposure value of (100% * 1.04 W/kg)/(1.6 W/kg) = 65.0% ± 1dB design related uncertainty (note that this level will be achieved by green and black curves if LTE remains in all-up bits for longer time duration which was already demonstrated in maximum Tx power test in Section 11.1). Total normalized time-averaged exposure (green curve) for this test should be within the calculated range between 35.0% ± 2.1dB device related uncertainty (only PD exposure) and 65.0% ± 1dB design related uncertainty (only SAR exposure).

As can be seen, the power limiting enforcement is effective during transmission when SAR and PD exposures are switched, and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

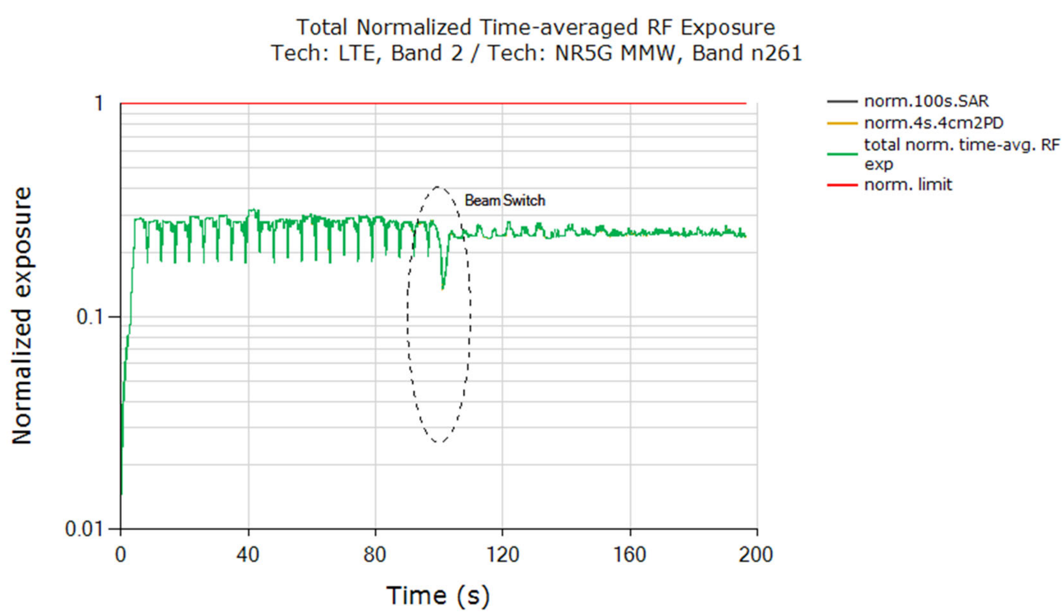
## 11.5 Change in Beam test results for n261

This test was measured with LTE Band 2 (DSI = 3) and mmW Band n261, with beam switch from Beam ID 19 to Beam ID 1, by following the test procedure is described in Section 5.3.3.

Instantaneous conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged radiated mmW Tx power limits for beam 19 and beam 1:



Normalized time-averaged exposures for LTE and mmW (4cm$^2$PD), as well as total normalized time-averaged exposure versus time:



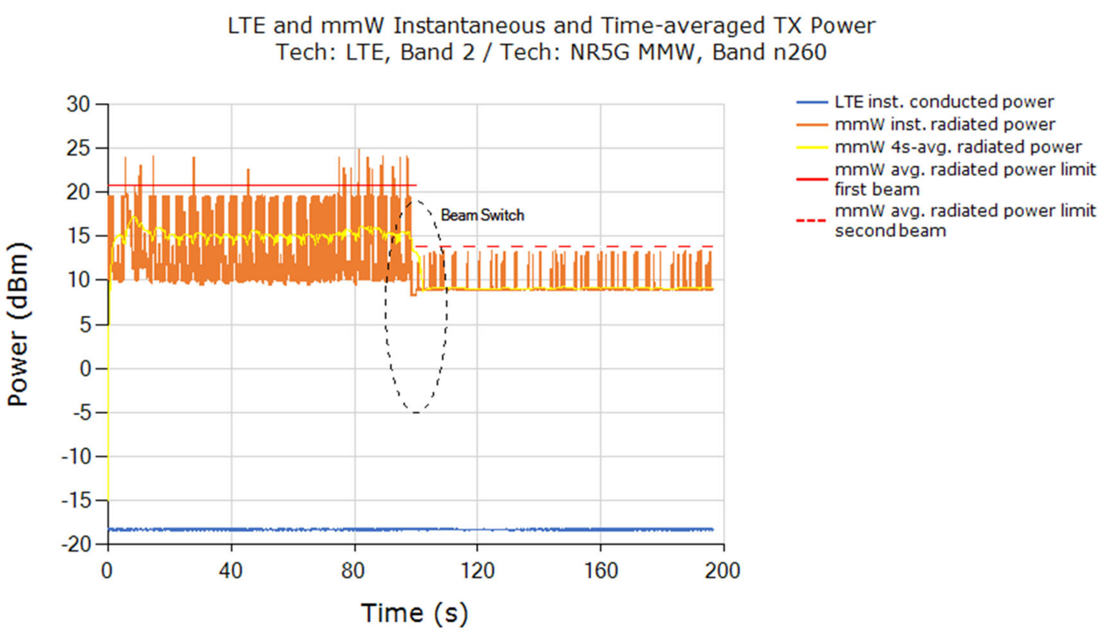
| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.318 |
| Validated | |

Plot notes: 5G mmW NR call was established at ~1s time mark and LTE was placed in all-down bits immediately after 5G mmW NR call was established. For the rest of this test, mmW exposure is the dominant contributor as LTE is left in all-down bits. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). From Table 10-3, exposure between 1s ~100s corresponds to a normalized 4cm2PD exposure value for Beam ID 19 of (75% * 4.23 W/m2)/(10 W/m2) = 31.7% ± 2.1dB device related uncertainty. At ~100s time mark (shown in black dotted ellipse), beam was switched to Beam ID 1. Note that the *input.power.limit* for Beam ID 1 is 9.3dBm. Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). Therefore, normalized $4cm^2$PD exposure value for n261 Beam ID 1 = (75% * 4.05 $W/m^2$)/(10 $W/m^2$) = 30.4% ± 2.1dB device related uncertainty. Additionally, during the switch, the ratio between the averaged radiated powers of the two beams (yellow curve) should correspond to the difference in EIRPs measured at each corresponding *input.power.limit* for these beams listed in Table 10-3, i.e., 3.6 dB ± 2.1dB device uncertainty.

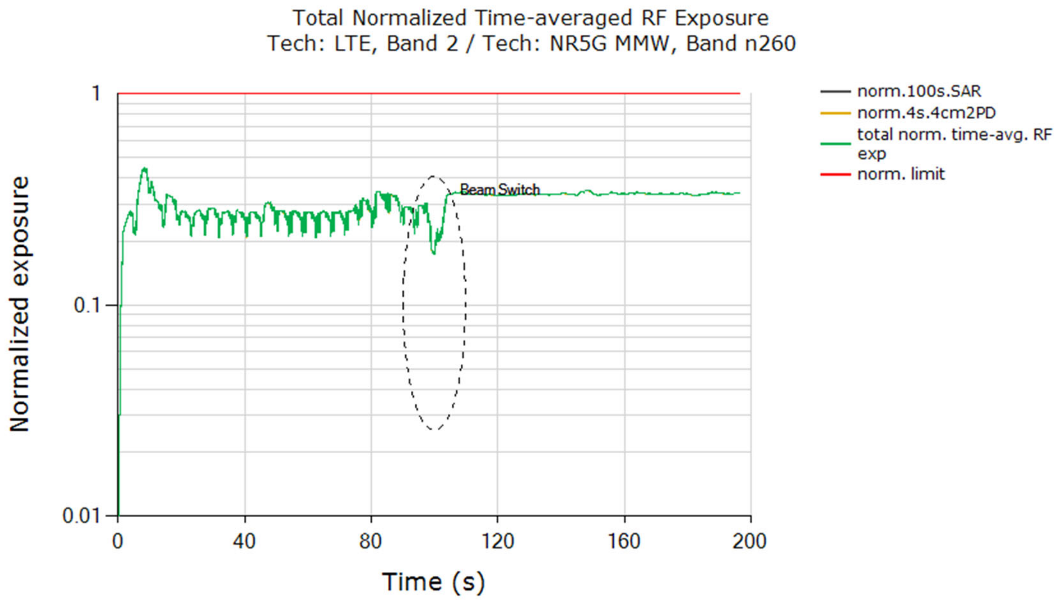
## 11.6 Change in Beam test results for n260

This test was measured with LTE Band 2 (DSI = 3) and mmW Band n260, with beam switch from Beam ID 26 to Beam ID 1, by following the test procedure is described in Section 5.3.3.

Instantaneous conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged radiated mmW Tx power limits for beam 26 and beam 1:



Normalized time-averaged exposures for LTE and mmW ($4cm^2$PD), as well as total normalized time-averaged exposure versus time:



| | |
|---|---|
| FCC requirement for total RF exposure (normalized) | 1.0 |
| Max total normalized time-averaged RF exposure (green curve) | 0.444 |
| Validated | |

Plot notes: 5G mmW NR call was established at ~1s time mark and LTE was placed in all-down bits immediately after 5G mmW NR call was established. For the rest of this test, mmW exposure is the dominant contributor as LTE is left in all-down bits. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). From Table 10-3, exposure between 1s ~100s corresponds to a normalized 4cm$^2$PD exposure value for Beam ID 26 of (75% * 4.67 W/m$^2$)/(10 W/m$^2$) = 35.0% ± 2.1dB device related uncertainty. At ~100s time mark (shown in black dotted ellipse), beam was switched to Beam ID 1. Note that the *input.power.limit* for Beam ID 1 is 9.9 dBm, however the maximum input power for n260 CP-OFDM modulation is capped at 8.5dBm. Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). Therefore, normalized 4cm$^2$PD exposure value for n260 Beam ID 1 = (75% * 5.01 W/m$^2$)/(10 W/m$^2$) = 37.6% ± 2.1dB device related uncertainty. Additionally, during the switch, the ratio between the averaged radiated powers of the two beams (yellow curve) should correspond to the difference in EIRPs measured at each corresponding *input.power.limit* for these beams listed in Table 10-3, i.e., 6.6dB ± 2.1dB device uncertainty.

# 12 SYSTEM VERIFICATION (FREQ > 6 GHZ)

The system was verified to be within ±0.66 dB of the power density targets on the calibration certificate according to the test system specification in the user's manual and calibration facility recommendation. The 0.66 dB deviation threshold represents the expanded uncertainty for system performance checks using SPEAG's mmWave verification sources. The same spatial resolution and measurement region used in the source calibration was applied during the system check.

The measured power density distribution of verification source was also confirmed through visual inspection to have no noticeable differences, both spatially (shape) and numerically (level) from the distribution provided by the manufacturer, per November 2017 TCBC Workshop Notes.

**Table 12-1**
**System Verification Results**

| System Verification | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Syst. | Freq. (GHz) | Date | Source SN | Probe SN | Normal psPD (W/m$^2$ over 4 cm$^2$) | | Deviation (dB) | Total psPD (W/m$^2$ over 4 cm$^2$) | | Deviation (dB) |
| | | | | | measured | target | | measured | target | |
| N | 30 | 7/6/2020 | 1035 | 9420 | 28.80 | 32.10 | -0.47 | 29.40 | 32.50 | -0.44 |
| N | 30 | 7/7/2020 | 1035 | 9420 | 28.50 | 32.10 | -0.52 | 29.40 | 32.50 | -0.44 |

Note: A **10 mm distance spacing** was used from the reference horn antenna aperture to the probe element. This includes 4.45 mm from the reference antenna horn aperture to the surface of the verification source plus 5.55 mm from the surface to the probe. The SPEAG software requires a setting of "5.55 mm" for the correct set up.

Notes:

1. CBT (Calibrated Before Testing). Prior to testing, the measurement paths containing a cable, amplifier, attenuator, coupler or filter were connected to a calibrated source (i.e. a signal generator) to determine the losses of the measurement path. The power meter offset was then adjusted to compensate for the measurement system losses. This level offset is stored within the power meter before measurements are made. This calibration verification procedure applies to the system verification and output power measurements. The calibrated reading is then taken directly from the power meter after compensation of the losses for all final power measurements.
2. Due to the worldwide pandemic caused by the novel SAR-CoV-2 virus (COVID-19), special calibration extensions have been permitted by A2LA. Some equipment had its calibration period extended accordingly and will be calibrated when possible.
3. Each equipment item is used solely within its respective calibration period.

# 15 CONCLUSION

## 15.1 Measurement Conclusion

The SAR evaluation indicates that the DUT complies with the RF radiation exposure limits of the FCC and Innovation, Science, and Economic Development Canada, with respect to all parameters subject to this test. These measurements were taken to simulate the RF effects of RF exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The results and statements relate only to the item(s) tested.

Please note that the absorption and distribution of electromagnetic energy in the body are very complex phenomena that depend on the mass, shape, and size of the body, the orientation of the body with respect to the field vectors, and the electrical properties of both the body and the environment. Other variables that may play a substantial role in possible biological effects are those that characterize the environment (e.g. ambient temperature, air velocity, relative humidity, and body insulation) and those that characterize the individual (e.g. age, gender, activity level, debilitation, or disease). Because various factors may interact with one another to vary the specific biological outcome of an exposure to electromagnetic fields, any protection guide should consider maximal amplification of biological effects as a result of field-body interactions, environmental conditions, and physiological variables. ## APPENDIX C: TEST SEQUENCES

1. Test sequence is generated based on below parameters of the DUT:
   a. Measured maximum power ($P_{max}$)
   b. Measured Tx_power_at_SAR_design_target ($P_{limit}$)
   c. Reserve_power_margin (dB)
      - $P_{reserve}$ (dBm) = measured $P_{limit}$ (dBm) – Reserve_power_margin (dB)
   d. *SAR_time_window* (100s for FCC)
2. Test Sequence 1 Waveform:

   Based on the parameters above, the Test Sequence 1 is generated with one transition between high and low Tx powers. Here, high power = $P_{max}$; low power = $P_{max}$/2, and the transition occurs after 80 seconds at high power $P_{max}$. As long as the power enforcement is taking into effective during one 100s/60s time window, the validation test with this defined test sequence 1 is valid, otherwise, select other radio configuration (band/DSI within the same technology group) having lower $P_{limit}$ for this test. The Test sequence 1 waveform is shown below:

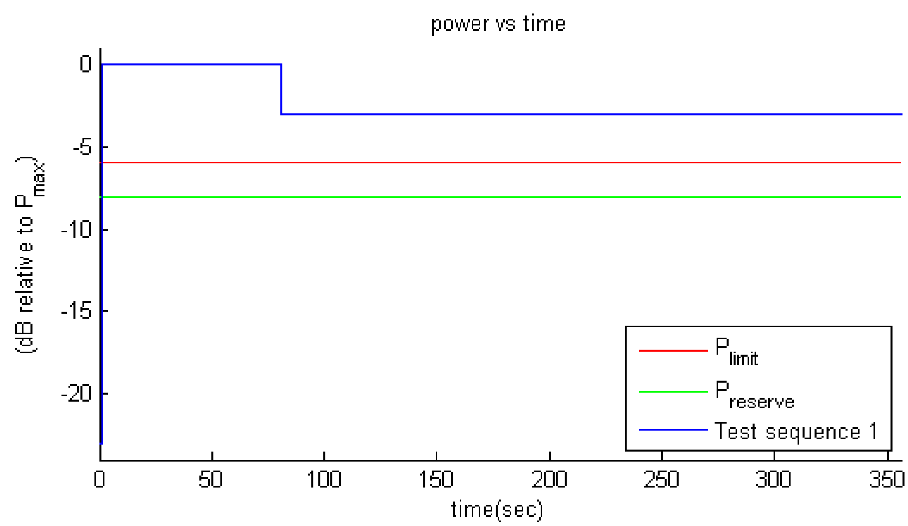

**Figure C-1**
**Test sequence 1 waveform**

3. Test Sequence 2 Waveform:

Based on the parameters described above, the Test Sequence 2 is generated as described in Table 10-1, which contains two 170 second-long sequences (yellow and green highlighted rows) that are mirrored around the center row of 20s, resulting in a total duration of 360 seconds:

**Table C-1**
**Test Sequence 2**

| Time duration (seconds) | dB relative to $P_{limit}$ or $P_{reserve}$ |
|---|---|
| 15 | $P_{reserve}$ – 2 |
| 20 | $P_{limit}$ |
| 20 | ($P_{limit}$ + $P_{max}$)/2 averaged in mW and rounded to nearest 0.1 dB step |
| 10 | $P_{reserve}$ – 6 |
| 20 | $P_{max}$ |
| 15 | $P_{limit}$ |
| 15 | $P_{reserve}$ – 5 |
| 20 | $P_{max}$ |
| 10 | $P_{reserve}$ – 3 |
| 15 | $P_{limit}$ |
| 10 | $P_{reserve}$ – 4 |
| 20 | ($P_{limit}$ + $P_{max}$)/2 averaged in mW and rounded to nearest 0.1 dB step |
| 10 | $P_{reserve}$ – 4 |
| 15 | $P_{limit}$ |
| 10 | $P_{reserve}$ – 3 |
| 20 | $P_{max}$ |
| 15 | $P_{reserve}$ – 5 |
| 15 | $P_{limit}$ |
| 20 | $P_{max}$ |
| 10 | $P_{reserve}$ – 6 |
| 20 | ($P_{limit}$ + $P_{max}$)/2 averaged in mW and rounded to nearest 0.1 dB step |
| 20 | $P_{limit}$ |
| 15 | $P_{reserve}$ – 2 |

The Test Sequence 2 waveform is shown in Figure C-2.

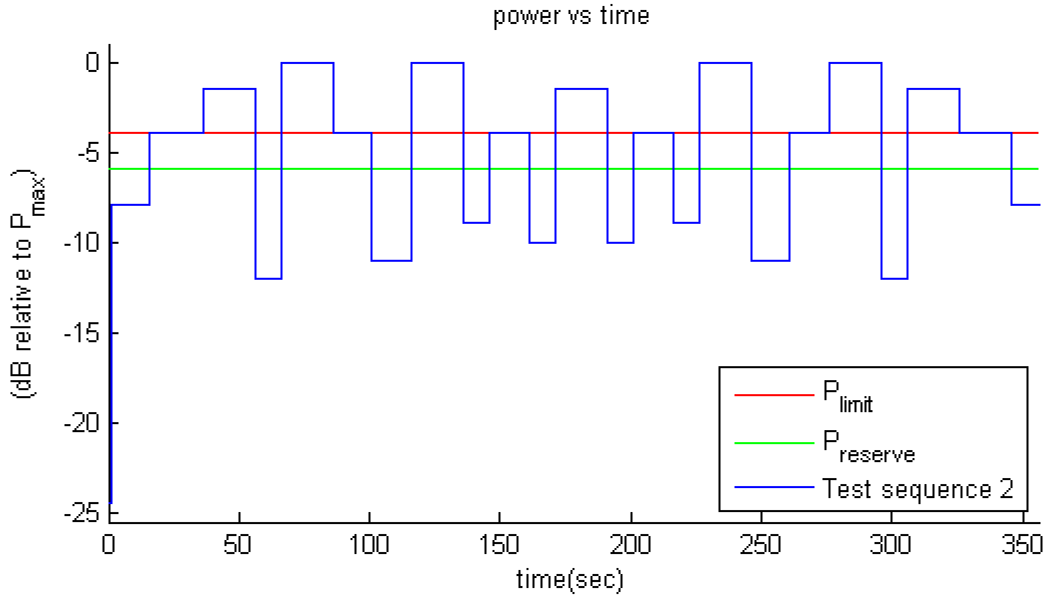

**Figure C-2**
**Test sequence 2 waveform**

# APPENDIX D: TEST PROCEDURES FOR SUB6 NR + NR RADIO

Appendix D provides the test procedures for validating Qualcomm Smart Transmit feature for LTE + Sub6 NR non-standalone (NSA) mode transmission scenario, where sub-6GHz LTE link acts as an anchor.

## D.1 Time-varying Tx power test for sub6 NR in NSA mode

Follows Section 4.2.1 to select test configurations for time-varying test. This test is performed with two pre-defined test sequences (described in Section 4.1) applied to Sub6 NR (with LTE on all-down bits or low power for the entire test after establishing the LTE+Sub6 NR call with the callbox). Follow the test procedures described in Section 4.3.1 to demonstrate the effectiveness of power limiting enforcement and that the time averaged Tx power of Sub6 NR when converted into 1gSAR values does not exceed the regulatory limit at all times (see Eq. (1a) and (1b)). Sub6 NR response to test sequence1 and test sequence2 will be similar to other technologies (say, LTE), and are shown in Sections 9.1.7 and 9.1.8.

## D .2 Switch in SAR exposure between LTE vs. Sub6 NR during transmission

This test is to demonstrate that Smart Transmit feature accurately accounts for switching in exposures among SAR for LTE radio only, SAR from both LTE radio and sub6 NR, and SAR from sub6 NR only scenarios, and ensures total time-averaged RF exposure compliance with FCC limit.

**Test procedure:**

1. Measure conducted Tx power corresponding to $P_{limit}$ for LTE and sub6 NR in selected band. Test condition to measure conducted $P_{limit}$ is:
   - Establish device in call with the callbox for LTE in desired band. Measure conducted Tx power corresponding to LTE $P_{limit}$ with Smart Transmit enabled and *Reserve_power_margin* set to 0 dB, callbox set to request maximum power.
   - Repeat above step to measure conducted Tx power corresponding to Sub6 NR $P_{limit}$. If testing LTE+Sub6 NR in non-standalone mode, then establish LTE+Sub6 NR call with callbox and request all down bits for radio1 LTE. In this scenario, with callbox requesting maximum power from Sub6 NR, measured conducted Tx power corresponds to radio2 $P_{limit}$ (as radio1 LTE is at all-down bits)
2. Set *Reserve_power_margin* to actual (intended) value with EUT setup for LTE + Sub6 NR call. First, establish LTE connection in all-up bits with the callbox, and then Sub6 NR connection is added with callbox requesting UE to transmit at maximum power in Sub6 NR. As soon as the Sub6 NR connection is established, request all-down bits on LTE link (otherwise, Sub6 NR will not have sufficient RF exposure margin to sustain the call with LTE in all-up bits). Continue LTE (all-down bits)+Sub6 NR transmission for more than one time-window duration to test predominantly Sub6 NR SAR exposure scenario (as SAR exposure is negligible from all-down bits in LTE). After at least one time-window, request LTE to go all-up bits to test LTE SAR and Sub6 NR SAR exposure scenario. After at least one more time-window, drop (or request all-down bits) Sub6 NR transmission to test predominantly LTE SAR exposure scenario. Continue the test for at least one more time-window. Record the conducted Tx powers for both LTE and Sub6 NR for the entire duration of this test.

3. Once the measurement is done, extract instantaneous Tx power versus time for both LTE and Sub6 NR links. Similar to technology/band switch test in Section 4.3.3, convert the conducted Tx power for both these radios into 1gSAR value (see Eq. (6a) and (6b)) using corresponding technology/band $P_{limit}$ measured in Step 1, and then perform 100s running average to determine time-averaged 1gSAR versus time as illustrated in Figure 4-1. Note that here it is assumed both radios have Tx frequencies < 3GHz, otherwise, 60s running average should be performed for radios having Tx frequency between 3GHz and 6GHz.
4. Make one plot containing: (a) instantaneous Tx power versus time measured in Step 2.
5. Make another plot containing: (a) instantaneous 1gSAR versus time determined in Step 3, (b) computed time-averaged 1gSAR versus time determined in Step 3, and (c) corresponding regulatory $1gSAR_{limit}$ of 1.6W/kg.

The validation criteria is, at all times, the time-averaged 1gSAR versus time shall not exceed the regulatory $1gSAR_{limit}$ of 1.6W/kg.

# APPENDIX E: CALIBRATION CERTIFICATES

**Calibration Laboratory of**
Schmid & Partner
Engineering AG
**Zeughausstrasse 43, 8004 Zurich, Switzerland**

**S** Schweizerischer Kalibrierdienst
**C** Service suisse d'étalonnage
**S** Servizio svizzero di taratura
Swiss Calibration Service

Accredited by the Swiss Accreditation Service (SAS)
**The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates**

Accreditation No.: **SCS 0108**

Client **PC Test**

Certificate No: **EUmmWV3-9420_Feb20**

# CALIBRATION CERTIFICATE

MAB 4/8/20

| | |
|---|---|
| Object | EUmmWV3 - SN:9420 |
| Calibration procedure(s) | QA CAL-02.v9, QA CAL-25.v7, QA CAL-42.v2<br>Calibration procedure for E-field probes optimized for close near field evaluations in air |
| Calibration date: | February 14, 2020 |

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

| Primary Standards | ID | Cal Date (Certificate No.) | Scheduled Calibration |
|---|---|---|---|

## Glossary:

| | |
|---|---|
| NORMx,y,z | sensitivity in free space |
| DCP | diode compression point |
| CF | crest factor (1/duty_cycle) of the RF signal |
| A, B, C, D | modulation dependent linearization parameters |
| Polarization φ | φ rotation around probe axis |
| Polarization ϑ | ϑ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., ϑ = 0 is normal to probe axis |
| Connector Angle | information used in DASY system to align probe sensor X to the robot coordinate system |
| Sensor Angles | sensor deviation from the probe axis, used to calculate the field orientation and polarization |
| $k$ | is the wave propagation direction |

## Calibration is Performed According to the Following Standards:

a) IEEE Std 1309-2005, "IEEE Standard for calibration of electromagnetic field sensors and probes, excluding antennas, from 9 kHz to 40 GHz", December 2005

## Methods Applied and Interpretation of Parameters:

- *NORMx,y,z:* Assessed for E-field polarization ϑ = 0 for XY sensors and ϑ = 90 for Z sensor (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). For frequencies > 6 GHz, the far field in front of waveguide horn antennas is measured for a set of frequencies in various waveguide bands up to 110 GHz.
- *DCPx,y,z:* DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- *PAR:* PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- The frequency sensor model parameters are determined prior to calibration based on a frequency sweep (sensor model involving resistors R, $R_p$, inductance L and capacitors C, $C_p$).
- *Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z*: *A, B, C, D* are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. *VR* is the maximum calibration range expressed in RMS voltage across the diode.
- *Sensor Offset*: The sensor offset corresponds to the mechanical from the probe tip (on probe axis). No tolerance required.
- *Connector Angle*: The angle is assessed using the information gained by determining the *NORMx* (no uncertainty required).
- *Equivalent Sensor Angle*: The two probe sensors are mounted in the same plane at different angles. The angles are assessed using the information gained by determining the *NORMx* (no uncertainty required).
- *Spherical isotropy (3D deviation from isotropy)*: in a locally homogeneous field realized using an open waveguide / horn setup.

# DASY - Parameters of Probe: EUmmWV3 - SN:9420

## Basic Calibration Parameters

| | Sensor X | Sensor Y | Unc (k=2) |
|---|---|---|---|
| Norm (μV/(V/m)$^2$) | 0.02240 | 0.02203 | ± 10.1 % |
| DCP (mV)[B] | 103.0 | 109.0 | |
| Equivalent Sensor Angle | -60.0 | 35.9 | |

## Calibration results for Frequency Response (750 MHz – 110 GHz)

| Frequency GHz | Target E-Field V/m | Deviation Sensor X dB | Deviation Sensor Y dB | Unc (k=2) dB |
|---|---|---|---|---|
| 0.75 | 77.2 | -0.08 | -0.06 | ± 0.43 dB |
| 1.8 | 140.4 | 0.06 | 0.10 | ± 0.43 dB |
| 2 | 133.0 | 0.06 | 0.09 | ± 0.43 dB |
| 2.2 | 124.8 | 0.05 | 0.07 | ± 0.43 dB |
| 2.5 | 123.0 | -0.05 | -0.06 | ± 0.43 dB |
| 3.5 | 256.2 | 0.12 | -0.03 | ± 0.43 dB |
| 3.7 | 249.8 | 0.20 | 0.03 | ± 0.43 dB |
| | | | | |
| 6.6 | 41.8 | -0.13 | 0.10 | ± 0.98 dB |

| 10 | 54.4 | -0.02 | 0.02 | ± 0.98 dB |
| 15 | 71.5 | 0.22 | -0.27 | ± 0.98 dB |
| 18 | 85.3 | 0.34 | 0.25 | ± 0.98 dB |
| | | | | |
| 26.6 | 96.9 | 0.15 | 0.14 | ± 0.98 dB |
| 30 | 92.6 | 0.08 | 0.08 | ± 0.98 dB |
| 35 | 93.7 | -0.19 | -0.07 | ± 0.98 dB |
| 40 | 91.5 | -0.53 | -0.43 | ± 0.98 dB |
| | | | | |
| 50 | 19.6 | -0.41 | -0.35 | ± 0.98 dB |
| 55 | 22.4 | 0.46 | 0.27 | ± 0.98 dB |
| 60 | 23.0 | -0.03 | -0.03 | ± 0.98 dB |
| 65 | 27.4 | 0.13 | 0.16 | ± 0.98 dB |
| 70 | 23.9 | 0.27 | 0.04 | ± 0.98 dB |
| 75 | 20.0 | -0.06 | 0.04 | ± 0.98 dB |
| | | | | |
| 75 | 14.8 | -0.27 | -0.11 | ± 0.98 dB |
| 80 | 22.5 | 0.09 | 0.22 | ± 0.98 dB |
| 85 | 22.8 | 0.00 | -0.01 | ± 0.98 dB |
| 90 | 23.8 | 0.06 | 0.06 | ± 0.98 dB |
| 92 | 23.9 | -0.13 | -0.18 | ± 0.98 dB |
| 95 | 20.5 | -0.26 | -0.23 | ± 0.98 dB |
| 97 | 24.4 | -0.02 | -0.02 | ± 0.98 dB |
| 100 | 22.6 | -0.01 | -0.06 | ± 0.98 dB |
| 105 | 22.7 | 0.01 | 0.03 | ± 0.98 dB |
| 110 | 19.7 | 0.09 | 0.11 | ± 0.98 dB |

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

[B] Numerical linearization parameter: uncertainty not required.

[E] Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

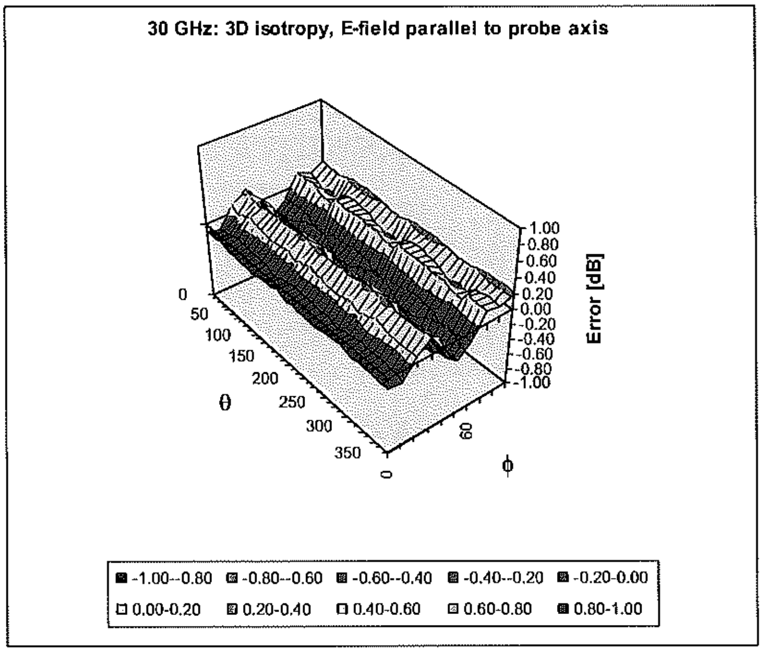
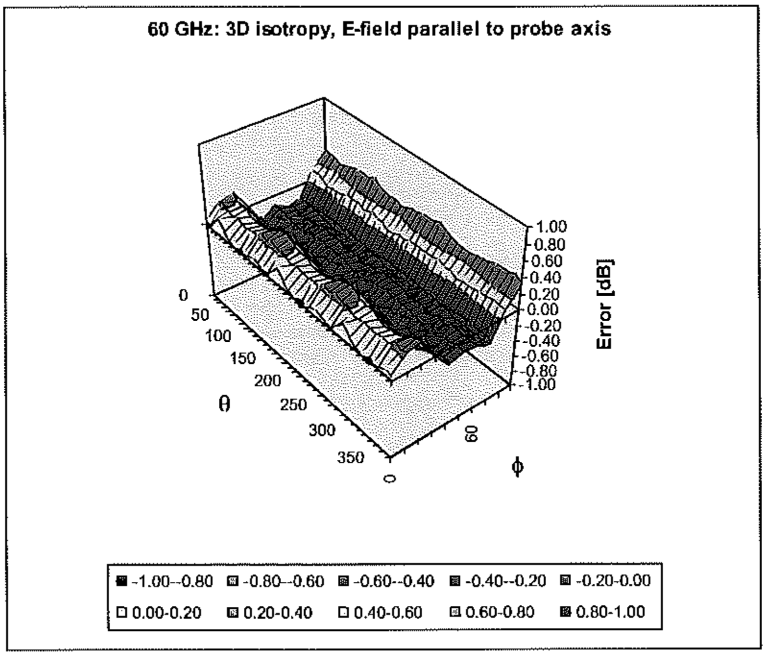
| Optical Surface Detection Mode | disabled |
| Probe Overall Length | 320 mm |
| Probe Body Diameter | 8 mm |
| Tip Length | 23 mm |
| Tip Diameter | 8.0 mm |
| Probe Tip to Sensor X Calibration Point | 1.5 mm |
| Probe Tip to Sensor Y Calibration Point | 1.5 mm |

# Deviation from Isotropy in Air

**f = 30, 60 GHz**





Probe isotropy for $E_{tot}$: probe rotated $\varphi$ = 0° to 360°, tilted from field propagation direction $\vec{k}$

Parallel to the field propagation ($\psi$ =0° - 90°) at 30 GHz: deviation within ± 0.36 dB

Parallel to the field propagation ($\psi$ =0° - 90°) at 60 GHz: deviation within ± 0.36 dB

| 10892 | AAC | 5G NR (CP-OFDM, 100% RB, 50 MHz, 64QAM, 120 kHz) | 5G NR FR2 TDD | 8.41 | ± 9.6 % |

[E] Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

# CALIBRATION CERTIFICATE

| | |
|---|---|
| Object | 5G Verification Source 30 GHz - SN: 1035 |
| Calibration procedure(s) | QA CAL-45.v2<br>Calibration procedure for sources in air above 6 GHz |
| Calibration date: | February 12, 2020 |

MAB 4/8/20

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

| Primary Standards | ID # | Cal Date (Certificate No.) | Scheduled Calibration |
|---|---|---|---|
| Reference Probe EUmmWV3 | SN: 9374 | 31-Dec-19 (No. EUmmWV3-9374_Dec19) | Dec-20 |
| DAE4ip | SN: 1602 | 01-Oct-19 (No. DAE4ip-1602_Oct19) | Oct-20 |

## Glossary

CW Continuous wave

## Calibration is Performed According to the Following Standards

- Internal procedure QA CAL-45-5Gsources
- IEC TR 63170 ED1, "Measurement procedure for the evaluation of power density related to human exposure to radio frequency fields from wireless communication devices operating between 6 GHz and 100 GHz", January 2018

## Methods Applied and Interpretation of Parameters

- *Coordinate System:* z-axis in the waveguide horn boresight, x-axis is in the direction of the E-field, y-axis normal to the others in the field scanning plane parallel to the horn flare and horn flange.
- *Measurement Conditions: (1) 10 GHz:* The forward power to the horn antenna is measured prior and after the measurement with a power sensor. During the measurements, the horn is directly connected to the cable and the antenna ohmic and mismatch losses are determined by far-field measurements. *(2) 30, 45, 60 and 90 GHz*: The verification sources are switched on for at least 30 minutes. Absorbers are used around the probe cub and at the ceiling to minimize reflections.
- *Horn Positioning:* The waveguide horn is mounted vertically on the flange of the waveguide source to allow vertical positioning of the EUmmW probe during the scan. The plane is parallel to the phantom surface. Probe distance is verified using mechanical gauges positioned on the flare of the horn.
- *E- field distribution:* E field is measured in two x-y-plane (10mm, 10mm + $\lambda/4$) with a vectorial E-field probe. The E-field value stated as calibration value represents the E-field-maxima and the averaged (1cm$^2$ and 4cm$^2$) power density values at 10mm in front of the horn.
- *Field polarization:* Above the open horn, linear polarization of the field is expected. This is verified graphically in the field representation.

## Calibrated Quantity

- Local peak E-field (V/m) and peak values of the total and normal component of the poynting vector |Re{S}| and n.Re{S} averaged over the surface area of 1 cm$^2$ ($pS_{tot}$avg1cm$^2$ and $pS_n$avg1cm$^2$) and 4cm$^2$ ($pS_{tot}$avg4cm$^2$ and $pS_n$avg4cm$^2$) at the nominal operational frequency of the verification source.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

| | | |

# DASY Report

## Measurement Report for 5G Verification Source 30 GHz, UID 0 -, Channel 30000 (30000.0MHz)

### Device under Test Properties

| Name, Manufacturer | Dimensions [mm] | IMEI | DUT Type |
|---|---|---|---|
| 5G Verification Source 30 GHz | 100.0 x 100.0 x 100.0 | SN: 1035 | - |

### Exposure Conditions

| Phantom Section | Position, Test Distance [mm] | Band | Group, | Frequency [MHz], Channel Number | Conversion Factor |
|---|---|---|---|---|---|
| 5G - | 5.55 mm | Validation band | CW | 30000.0, 30000 | 1.0 |

### Hardware Setup

| Phantom | Medium | Probe, Calibration Date | DAE, Calibration Date |
|---|---|---|---|
| mmWave Phantom - 1002 | Air | EUmmWV3 - SN9374_F1-78GHz, 2019-12-31 | DAE4ip Sn1602, 2019-10-01 |

### Scan Setup

| | 5G Scan |
|---|---|
| Grid Extents [mm] | 60.0 x 60.0 |
| Grid Steps [lambda] | 0.25 x 0.25 |
| Sensor Surface [mm] | 5.55 |
| MAIA | MAIA not used |

### Measurement Results

| | 5G Scan |
|---|---|
| Date | 2020-02-12, 08:14 |
| Avg. Area [cm²] | 1.00 |
| $pS_{tot}$ avg [W/m²] | 36.9 |
| $pS_n$ avg [W/m²] | 36.5 |
| $E_{peak}$ [V/m] | 126 |
| Power Drift [dB] | -0.05 |
