4.6.1 The variant models

- SM-N985F

4.7 EUT Frequencies

| The highest frequencies (Generated and used) | Frequency [MHz] |
|---|-------------------|
| Wi-Fi | 5 825 |
| UWB | 8 250 |

4.8 Test configuration and condition

The system was configured for testing in a typical fashion that a customer would normally use. Cables were attached to each of the available I/O Ports. Where applicable, peripherals were attached to the I/O cables. All the external I/O ports are exercised, as well as internal and the external SD card if available, by writing and reading arbitrary data or charging with TA.

The EUT was investigated in three orientations and the worst case orientation is reported.

RX mode(850MHz) testing was performed with the LTE FDD26 RX Test mode at center frequency. All licensed communication (850MHz) RX mode, GSM/WCDMA/LTE, test results are not significantly different.

The video and audio were repetitively played with earphone connected.

The video were played on monitor through Display Out function using direct DP Cable.

The camera of the EUT was operated continuously.

Power source for the EUT operating was supplied by CVCF made by the Pacific Corp.

- Test Voltage : AC 120 V, 60 Hz

4.9 Measurement uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus: (According to CISPR 16-4-2 and UKAS M3003)

4.9.1 Emission

| Test type | | Measurement uncertainty (C.L. 95 %, k = 2) |
|---------------------------------------|------------|---|
| Conducted disturbance | AC Mains | 2.83 dB |
| Radiated Disturbance (Below 1 GHz) | Horizontal | 4.08 dB |
| | Vertical | 4.58 dB |
| Radiated Disturbance (Above 1 GHz) | Horizontal | 5.21 dB |
| | Vertical | 5.22 dB |

* Remark

1) The values for uncertainty of conducted and radiated emissions are less than the Corresponding values of Ucispr given in CISPR 55016-4-2. Therefore no adjustment of measurement results is necessary when comparing them with the relevant limits.

5. Results of individual test

5.1 Conducted disturbance

The EUT is connected to a LISN via travel adapter. If the EUT is connected to the Laptop Computer USB port, the Laptop AC adapter is connected to a LISN.

Both conducted lines are measured in Quasi-Peak and CISPR-Average mode, including the worst-case data points for each tested configuration. The EUT measured in accordance with the methods described in standards.

Limits for conducted disturbance at the mains ports of Class B ITE

| Frequency range Limits [MHz] | Resolution Bandwidth [kHz] | Limits [dB(μV)] | |
|-----------------------------------|---------------------------------|-------------------|----------|
| | | Quasi-peak | Average |
| 0.15 to 0.50 | 9 | 66 to 56 | 56 to 46 |
| 0.50 to 5 | 9 | 56 | 46 |
| 5 to 30 | 9 | 60 | 50 |

NOTE 1 The lower limit shall apply at the transition frequency.
NOTE 2 The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

5.2 Radiated disturbance

The following data lists the significant emission frequencies, measured levels, correction factors (for antenna and cables), orientation of table, polarization and height of antenna, the corrected reading, the limit, and the amount of margin.

Peak measurements were made over the changeable frequency range 30 MHz to 1 GHz at a measurement distance of 10 m for the following antenna and turntable arrangements:

| Antenna Height [cm] | Antenna Polarisation | Resolution Bandwidth [kHz] | Video Bandwidth [kHz] | Turntable position [degrees] |
|--------------------------|----------------------|------------------------------------|-------------------------------|-----------------------------------|
| 100 ~ 400 | Horizontal, Vertical | 120 | 300 | Continuous |

Measurements within 6 dB of the limit were then maximized by adjusting turntable position. Final measurements were made using quasi-peak detector.

Peak/CISPR-Average measurements were made over the changeable frequency range 1 GHz to 40 GHz or 5th harmonics of the highest frequency generated or used in the device or on which the device operates or tunes at a measurement distance of 3 m for the following antenna and turntable arrangements. The measurements above 1 GHz were performed with the bore-sighting antenna aimed at the EUT.

| Antenna Height [cm] | Antenna Polarisation | Resolution Bandwidth [MHz] | Video Bandwidth [MHz] | Turntable position |
|--------------------------|----------------------|------------------------------------|-------------------------------|--------------------|
| 100 ~ 400 | Horizontal, Vertical | 1 | 3 | Continuous |

Measurements within 6 dB of the limit were then maximized by adjusting turntable position. Final measurements were made using peak and CISPR-average detectors.

Limits for radiated disturbance of Class B ITE at a measuring distance of 3 m and 10 m

| Frequency range Limits [MHz] | Field Strength | | |
|-----------------------------------|-------------------|------------------------|-------------------------|
| | 3 m [μ V/m] | 3 m [dB(μ V/m)] | 10 m [dB(μ V/m)] |
| 30 to 88 | 100 | 40.0 | 29.5 |
| 88 to 216 | 150 | 43.5 | 33.0 |
| 216 to 960 | 200 | 46.0 | 35.5 |
| Above 960 | 500 | 54.0 | 43.5 |

Note) Distance correction formula from $D_1(3m)$ to $D_2(10m)$
: Limit at $D_2 = \text{Limit at } D_1 + 20\text{Log}(D_1 / D_2)$

Results checked manually; and points close to the limit line were re-measured.

Result (QP) = Reading (QP) + c.f (Antenna Factor + Cable Loss - Amp. Gain)

Margin (QP) = Limit - Level (QP)

QP = Quasi-Peak, c.f = Correction Factor

- Frequencies above 1 GHz

Note 1) We have also tested from 18 GHz to 40 GHz and found no emissions

Note 2) Receiving antenna polarization : Horizontal, Vertical

Test Distance : 3 m, Antenna Height : 1 to 4 meters

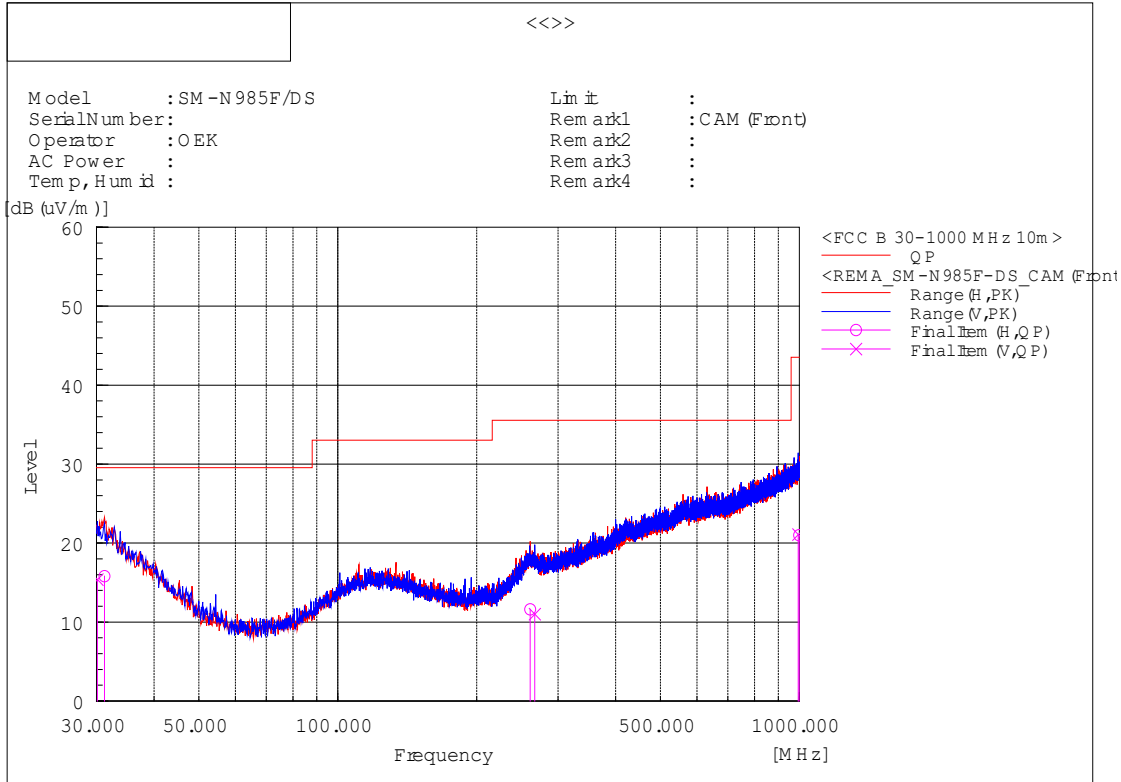

Level (PK and/or CAV) = Reading (PK and/or CAV) + Corr. (Antenna Factor + Cable Loss - Amp. Gain)

Margin (PK and/or CAV) = Limit – Level (PK and/or CAV)
