C63.19-2019 HAC Verdict: PASS

Note: This revised Test Report (S/N: 1M2308210092-28-R1.A3L) supersedes and replaces the previously issued test report on the same subject device for the same type of testing as indicated. Please discard or destroy the previously issued test report(s) and dispose of it accordingly.

This wireless portable device has been shown to be hearing-aid compatible, specified in ANSI/IEEE Std. C63.19-2019 and ANSI/TIA-5050-2018 and has been tested in accordance with the specified measurement procedures. Test results reported herein relate only to the item(s) tested. Hearing-Aid Compatibility is based on the assumption that all production units will be designed electrically identical to the device tested in this report. North American Bands only.

I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

1. INTRODUCTION

On July 10, 2003, the Federal Communications Commission (FCC) adopted new rules requiring wireless manufacturers and service providers to provide digital wireless phones that are compatible with hearing aids. The FCC has modified the exemption for wireless phones under the Hearing Aid Compatibility Act of 1998 (HAC Act) in WT Docket 01-309 RM-8658¹ to extend the benefits of wireless telecommunications to individuals with hearing disabilities. These benefits encompass business, social and emergency communications, which increase the value of the wireless network for everyone. An estimated more than 10% of the population in the United States show signs of hearing impairment and of that fraction, almost 80% use hearing aids. Approximately 500 million people worldwide and 30 million people in the United States suffer from hearing loss.

Compatibility Tests Involved:

The standard calls for wireless communications devices to be measured for:

- RF Electric-field emissions
- T-coil mode, magnetic-signal strength in the audio band
- T-coil mode, magnetic-signal frequency response through the audio band
- T-coil mode, magnetic-signal and noise articulation index
- T-coil mode, acoustic-signal conversational gain in the audio band
- T-coil mode, acoustic-signal frequency response through the audio band
- T-coil mode, acoustic-signal distortion through audio band
- Volume Control, receive volume control performance
- Volume Control, receive distortion and noise performance
- Volume Control, receive acoustic frequency response performance

The hearing aid may be measured for:

- RF immunity in microphone mode
- RF immunity in T-coil mode

In the following tests and results, this report includes the evaluation for a wireless communications device.

I. LTE Band Selection

This device supports LTE capabilities with overlapping transmission frequency ranges. When the supported frequency range of one LTE band falls completely within another LTE band with a larger transmission frequency range, both LTE bands have the same target power (or the band with the larger transmission frequency range has a higher target power), and both LTE bands share the same transmission path and signal characteristics, hearing-aid compatibility compliance was only assessed for the band with the larger transmission frequency range. However, overlapped LTE bands which are anchor bands for dual connectivity (EN-DC) scenarios between LTE and NR were evaluated as independent LTE bands.

II. NR Band Selection

This device supports NR capabilities with overlapping transmission frequency ranges. When the supported frequency range of an NR band falls completely within an NR band with a larger transmission frequency range, both NR bands have the same target power (or the band with the larger transmission frequency range has a higher target power), and both NR bands share the same transmission path and signal characteristics, hearing-aid compatibility compliance was only assessed for the band with the larger transmission frequency transmission frequency.

3. ANSI C63.19-2019 PERFORMANCE CATEGORIES

I. Acoustic Coupling Requirements

According to ANSI C63.19-2019 §7, devices shall comply with ANSI/TIA-5050-2018 in order to comply with C63.19-2019. No additional requirements are imposed and no special allowances are made regarding testing to and compliance with ANSI/TIA-5050-2018.

II. ANSI/TIA-5050-2018 Volume Control

All Volume Control requirements (i.e., Volume Control, Distortion and Noise, and Frequency Response) shall be met for at least one volume control setting for narrowband as well as wideband (as applicable) per §5. All testing shall be performed with both a 2N mounting force and an 8N mounting force. The passing volume control setting may be different between narrowband and wideband tests as well as between 2N and 8N tests, but the setting may not change within a test in order to pass the separate performance criteria.

Note: The test data margins indicate a margin from the limit for compliance.

1. Receive Volume Control Performance

With a mounting force of 8N, the EUT shall have a Conversational Gain of \geq 18dB per §5.1.1, and with a mounting force of 2N, the EUT shall have a Conversational Gain of \geq 6dB per ANSI/TIA-5050-2018 §5.1.1.

2. Receive Distortion and Noise Performance

With a mounting force of 8N and 2N, the Pulsed Noise Signal-to-Distortion Ratio (PN-SDNR) of the stimulus signal to the 100Hz to 8kHz total distortion and noise shall be \geq 20dB when tested over the applicable 1/3 octave band center frequencies per ANSI/TIA-5050-2018 §5.2.1. For narrowband, the applicable 1/3 octave band center frequencies are those from 400Hz to 3.15kHz; for wideband, the applicable 1/3 octave band center frequencies are those from 250Hz to 5kHz.

3. Receive Acoustic Frequency Response Performance

With a mounting force of 8N and 2N, the receive frequency response, as measured at the DRP in 1/12 octave bands and after translation to the diffuse field or free field, shall fall between the applicable upper and lower limits per ANSI/TIA-5050-2018 §5.3.1. See below for narrowband limits (Table 3-1 and Figure 3-1) and wideband limits (Table 3-2 and Figure 3-2).

II. Head and Torso Simulator

| Manufacturer: | Brüel & Kjær | |
|---------------------------------|---|---|
| Model: | Type 4128-D | |
| Frequency Response: | Conforms to ITU-T Rec. P.58 up to 16 kHz | |
| Ear Simulator: | based calibrated ear simulator complying with ITU-T Rec. P.57 | |
| Ear Simulator Output: | 7-core, 3 m cable terminated with a Lemo® (1B) plug | |
| Pressure-field Response: | ±1 dB from 5 Hz to 7 kHz ±3 dB from 3.15 Hz to 20 kHz | |
| Typical Noise Level | 19 dBA at DRP | |
| Pinna Simulator: | Compliant with ITU-T Rec. P.58 | 25 |
| Total Head and Torso Height: | 695mm | |
| HATS Dimensions: | Main dimensions comply with the dimensional requirements of | -line - |
| | ITU-T Rec. P.58 | Figure 4-3 |
| Handset Positioner: | Brüel & Kjær Type 4606 | (with Handset Positioner) |
| Positioner Angles: | Variable positions; $\angle A$ adjustable from +15' -10°, $\angle C$ adjustable from +20° to -20°; 0.5' | ° to +35°, ∠B adjustable from +30° to $^\circ$ resolution |
| Applied Ear Force: | Mounting force can be adjusted from 0 to 1 | 8 N |

III. IEEE Std 269 Uncompressed Real Male Speech

| Manufacturer: | IEEE |
|-------------------------|--|
| Active Frequency Range: | 100 Hz – 8 kHz |
| Stimulus Type: | Multi-talker speech signal, four male speakers |
| Single Sample Duration: | 12 seconds |
| Activity Level: | 84% |

Figure 4-5 Acoustic Measurement Processing Steps

IV. Test Procedure

- 1. Ambient Noise Check per ANSI/TIA-5050-2018 §3.1 (See Figure 4-2)
 - a. Ambient noise was monitored using a Real-Time Analyzer between 100-10,000 Hz with 1/12 octave filtering.
 - b. "A-weighting" was applied to the measurements per the definition of a "quiet room" in ANSI/TIA-5050-2018. Below is the verification of the system processing A-weighting between system input to output within 0.5 dB of the theoretical result:

Table 4-1 A-weighting Frequency Response Validation

c. The ambient room noise is a power sum of the A-weighted spectrum from 100-10,000 Hz. To verify the power sum measurement, a power sum over the full band was measured and verified to track with the source level. Therefore, the setup in this step was used to verify the power sum post-processing for measurements. See below block diagram:

| -10 | -10.05 | -10.03 | 0.02 |

- d. The maximum room noise inside the quiet room was recorded and verified to be less than or equal to 40dBA.
- 2. Measurement System Validation (See Figure 4-1)
 - a. The measurement system including the HATS, pre-amplifier and acquisition system were validated as an entire system to ensure the reliability of test measurements.
 - b. HATS Sensitivity Verification A pure tone of 1kHz was applied into the HATS ear (microphone) using a calibrated sound calibrator. The sound calibrator generates an expected sound pressure level of 97.1dBSPL at the HATS ear which was used to verify the measured signal from the HATS. This measured value was verified to be within ±0.2dB of the 97.1dBSPL expected
- 3. Measurement Test Setup
 - a. Positioning DUT in HATS

value (see Page 29).

| FCC ID: A3LSMS928U | element | HAC (VOLUME CONTROL) TEST REPORT | Approved by: Managing Director |
|------------------------|-------------------------|----------------------------------|-----------------------------------|
| Filename: | Test Dates: | DUT Type: | Page 12 of 62 |
| 1M2308210092-28-R1.A3L | 10/09/2023 - 10/23/2023 | Portable Handset | 1 age 12 01 02 |

- i. According to ANSI/TIA-5050-2018 §4.2, a HATS which is ITU-T P.58 compliant and an ear simulator which is ITU-T P.57 type 3.3 compliant are used for Volume Control testing.
- ii. Per ANSI/TIA-5050-2018 §4.3, the DUT is positioned on the HATS in the standard test position according to IEEE Std 269 or, alternatively, a recommended test position specified by the manufacturer. Manufacturer recommended positions must comply with the recommended test position requirements in IEEE Std 269 and, if used, are noted in this report.
- iii. The DUT is mounted such that a certain force, in Newtons, is applied when the DUT is placed against the artificial pinna. ANSI/TIA-5050-2018 specifies a mounting force of either 2N or 8N, depending on the test. Mounting force is indicated for each test in this report.
- b. Speech Signal Setup and Analysis
 - i. For testing in this report, the test signal is the uncompressed real male speech as published with IEEE Std 269 unless otherwise specified.
 - ii. The test signal is used with an Active Speech Level (ASL) of -20dBm0, and analysis is performed with 1/12 octave bands averaged over one complete sequence of the test signal unless otherwise specified.
 - iii. The acoustic listener reference point for testing is the Free Field (FF) for Conversational Gain and PN-SDNR measurements. For Frequency Response (FR) measurements, the acoustic listener reference point is either the Free Field (FF) or the Diffuse Field (DF); the chosen acoustic listener reference point for FR measurements in this report is indicated for each test.
 - iv. Per the Spring 2021 TCB Workshop, all supported audio voice codecs are tested for the DUT. For each codec, narrowband and wideband modes are tested if supported. For narrowband modes, a source coding bit-rate of 12.2 kbps, or the closest available setting, is used. For wideband modes, a source coding bit-rate of 12.65 kbps, or the closest available setting, is used.
- c. DUT Radio Configuration
 - i. Each supported codec may be tested with any air interface which supports the codec being tested. Air interfaces used for testing in this report are noted with each test.
- 4. Measurement Data Analysis
 - a. Conversational Gain
 - i. With the DUT at its maximum volume control setting and tone control set such that the DUT meets the FR requirements, the test signal is applied to the DUT, and the resulting acoustic output is measured at the Drum Reference Point (DRP). A lower volume setting may be used if needed to meet the PN-SDNR requirements.
 - ii. The appropriate post processing is applied according to the system processing chain shown in Figure 4-5, and the Conversational Gain is determined.
 - iii. Conversational Gain is tested with both 8N and 2N mounting force.
 - b. PN-SDNR
 - i. The DUT is tested for distortion using PN-SDNR which is the ratio of the signal power to the full, A-weighted distortion and noise power of the DUR output (in dB).
 - ii. The pulsed noise stimulus signal is a combination of the real speech test signal followed by a series of pink noise pulses from a 1/3 octave band. A stimulus signal is generated for each 1/3 octave band centered within the applicable frequency range for either narrowband or wideband.
 - iii. Each stimulus signal is applied to the DUT, and the resulting acoustic output is measured at the DRP.

| FCC ID: A3LSMS928U | element | HAC (VOLUME CONTROL) TEST REPORT | Approved by: Managing Director |
|------------------------|-------------------------|----------------------------------|-----------------------------------|
| Filename: | Test Dates: | DUT Type: | Dogo 12 of 62 |
| 1M2308210092-28-R1.A3L | 10/09/2023 - 10/23/2023 | Portable Handset | Fage 15 01 02 |

- iv. The appropriate post processing is applied according to the system processing chain shown in Figure 4-5, and the PN-SDNR is determined by subtracting the full, A-weighted distortion and noise power, from the signal power, in This process is repeated to determine ethe PN-SDNR for all applicable 1/3 octave band center frequencies.
- v. PN-SDNR is tested with both 8N and 2N mounting force and may be repeated at volume levels below maximum if needed to get passing results. Note that Conversational Gain must still receive passing results while at the lower volume level if such a lower level is used for PN-SDNR compliance.
- c. Frequency Response
 - i. Frequency response is measured with respect to the appropriate curves from either Figure 3-1, for narrowband modes, or Figure 3-2, for wideband modes. The measurement is taken over one full sequence of the test signal, although a delay was configured in the measurement process of the stimulus to ensure handset vocoder latency effects and echo cancellation devices (if any) were appropriately stabilized during measurements.
 - ii. The appropriate post processing is applied according to the system processing chain shown in Figure 4-5, and the FR is determined. All 1/12 octave band center frequencies were plotted and aligned with respect to the applicable mask in a floating, or best fit, fashion.
 - iii. FR is tested with both 8N and 2N mounting force and may be repeated with tone control settings other than default if needed to get passing results. Note that Conversational Gain must still receive passing results while using the non-default tone control settings if such non-default settings are used for FR compliance.
- d. Speech Signal Setup to Base Station Simulator
 - i. See Section 6 and 8 for more information regarding CMW500 audio level settings for Voice Over LTE (VoLTE) and Voice Over WIFI (VoWIFI) testing.
 - ii. See Section 7 for more information regarding CMX500 audio level settings for Voice Over NR (VoNR).
- e. WD Radio Configuration Selection
 - i. The device was chosen to be tested in the default test configuration (See Section 5 for more information regarding worst-case configurations for GSM and UMTS. LTE configuration information can be found in Section 6. NR configuration information can be found in Section 7. WIFI configuration information can be found in Section 8.)

V. Test Setup

Environmental conditions such as temperature and relative humidity are monitored to ensure there are no impacts on system specifications. Proper voltage and power line frequency conditions are maintained with three phase power sources. Environmental noise and reflections are monitored through system checks.

VI. Deviation from ANSI/TIA-5050-2018 Test Procedure

Deviation from ANSI/TIA-5050-2018 Test Procedure to indicate guidance in FCC HAC waiver was followed.

VII. Air Interface Technologies Tested

According to ANSI/TIA-5050-2018, any air interface which support voice capabilities over a managed CMRS or pre-installed OTT VoIP applications may be chosen for Volume Control testing. According to the Spring 2021 TCB Workshop, all voice codecs supported by the DUT must be tested for Volume Control. The air interfaces used during testing were chosen such that all voice codecs supported by the DUT were able to be tested. See Table 2-1 for more details regarding which modes were tested.

VIII. Wireless Device Channels and Frequencies

1. 2G/3G Modes

The frequencies listed in the table below are those that lie in the center of the bands used for cellular telephony. The middle channel for each supported band was tested to confirm that results between bands are substantially similar. More information on default test configuration chosen for testing can be found in Section 5.

| Center Channels and Frequence | uencies | | | | | | | | | |
|--|--------------------|--|--|--|--|--|--|--|--|--|
| Test frequencies & associated channels | | | | | | | | | | |
| Channel | Frequency (MHz) | | | | | | | | | |
| Cellular 850 | | | | | | | | | | |
| 190 (GSM) | 836.60 | | | | | | | | | |
| 4183 (UMTS) | 836.60 | | | | | | | | | |
| AWS 1750 | | | | | | | | | | |
| 1412 (UMTS) | 1730.40 | | | | | | | | | |
| PCS 1900 | | | | | | | | | | |
| 661 (GSM) | 1880 | | | | | | | | | |
| 9400 (UMTS) | 1880 | | | | | | | | | |

| Table 4-3 | | | | | | | | | |
|---------------------------------|--|--|--|--|--|--|--|--|--|
| Center Channels and Frequencies | | | | | | | | | |
| | | | | | | | | | |

2. 4G (LTE) Modes

The middle channel for every band was tested for conversational gain to confirm that the band configuration for VoLTE over IMS does not substantially affect the results. The default band was additionally tested for Frequency Response and Distortion. More information on default LTE test configuration chosen for testing can be found in Section 6. See Table 10-4 for full volume control evaluation.

3. 5G (NR) Modes

The middle channel for every band was tested for conversational gain to confirm that the band configuration for VoNR over IMS does not substantially affect the results. The default band was additionally tested for Frequency Response and Distortion. More information on default NR test configuration chosen for testing can be found in Section 7. See Table 10-5 for full volume control evaluation.

4. WIFI

The middle channel for each IEEE 802.11 standard was tested for conversational gain to confirm that the standard and data rate configuration for VoWIFI over IMS does not substantially affect the results. The 2.4GHz IEEE802.11b was additionally tested for Frequency Response and Distortion. More information on default WIFI test configuration chosen for testing can be found in Section 8. See Table 10-6 for full volume control evaluation.

5. FCC 2G & 3G MEASUREMENTS

I. GSM Test Configurations

1. Band Configuration

An investigation was performed to ensure the GSM band used for testing does not substantially affect the measurement results. GSM EFR FR V1 codec was used for this evaluation. The effects of band configuration were found to be independent of radio configuration; therefore, only one radio configuration was used for this investigation. See below table for comparisons between different bands:

| | | | | | | <i>,</i> | | | | | |
|---------|---------|----------|-----------------------|-----------------|-------------------------------|----------|------------------------|----------------------------------|----------------------|----------------|---------|

II. UMTS Test Configurations

1. Radio Configuration

An investigation was performed to ensure that UMTS band used for testing does not substantially affect the measurement results. NB AMR 4.75KBPS, 13.6kbps SRB was used for this evaluation. The effects of band configuration were found to be independent of radio configuration; therefore, only one radio configuration was used for this investigation. See below table for comparisons between different bands:

| Mode | Channel | HAC Mode | Mounting Force (N) | Codec Bandwidth | Codec Codec Bitrate Volume Amt Indwidth (kbps) Level Noise | | Ambient Noise (dBA) | Conversational FCC CG Gain (CG) (dB) Limit (dB) | | CG Margin (dB) | Verdict | | |

6. VOLTE TEST SYSTEM SETUP AND DUT CONFIGURATION

I. Test System Setup for VoLTE over IMS T-coil Testing

1. Equipment Setup

The general test setup used for VoLTE over IMS is shown below. The callbox used when performing VoLTE over IMS Volume Control measurements is a CMW500. The Data Application Unit (DAU) of the CMW500 was used to simulate the IP Multimedia Subsystem (IMS) server.

2. Audio Level Settings

According to ANSI/TIA-5050-2018, the appropriate audio level to be used for VoLTE over IMS Volume Control testing is -20dBm0 (ASL) and shall be used for the normal speech input level. The CMW500 base station simulator was manually configured to ensure that the settings for speech input and full scale levels resulted in the -20dBm0 (ASL) speech input level to the DUT for the VoLTE over IMS connection.

II. DUT Configuration for VoLTE over IMS Volume Control Testing

1. Radio Configuration

An investigation was performed to ensure the modulation and RB configuration used for testing do not substantially affect the measurement results. The effects of modulation and RB configuration were found to be independent of band and bandwidth; therefore, only one band and bandwidth were used for this investigation. 16QAM, 1RB, 0RB offset was used as the default testing configuration for the handset given the results of this investigation. See below table for comparison between different radio configurations:

7. VONR TEST SYSTEM SETUP AND DUT CONFIGURATION

I. Test System Setup for VoNR over IMS T-coil Testing

1. Equipment Setup

The general test setup used for VoNR over IMS is shown below. The callboxes used when performing VoNR over IMS Volume Control measurements are a CMX500 and CMW500. The Data Application Unit (DAU) of the CMW500 was used to simulate the IP Multimedia Subsystem (IMS) server. The CMX500 provided the baseband signal to perform NR signaling. An external USB audio interface is used to perform the A/D conversion and ensure proper speech input level to the DUT.

Figure 7-1 Test Setup for VoNR over IMS Volume Control Measurements

2. Audio Level Settings

According to ANSI/TIA-5050-2018, the appropriate audio level to be used for VoNR over IMS Volume Control testing is -20dBm0 (ASL) and shall be used for the normal speech input level. The acoustic test system was manually configured to ensure that the settings for speech input and full scale levels resulted in the -20dBm0 (ASL) speech input level to the DUT for the VoNR over IMS connection.

II. DUT Configuration for VoNR over IMS Volume Control Testing

1. Radio Configuration

An investigation was performed to ensure the waveform, modulation, and RB configuration used for testing do not substantially affect the measurement results. The effects of waveform, modulation, and RB configuration were found to be independent of band and bandwidth; therefore, only one band and bandwidth were used for this investigation. DFT-s-OFDM, 16QAM, 1RB, 1RB offset was used as the default testing configuration for the handset given the results of this investigation. See below table for comparison between different radio configurations:

8. VOWIFI TEST SYSTEM SETUP AND DUT CONFIGURATION

I. Test System Setup for VoWIFI over IMS T-coil Testing

1. Equipment Setup

The general test setup used for VoWIFI over IMS, or CMRS WIFI Calling, is shown below. The callbox used when performing VoLTE over IMS Volume Control measurements is a CMW500. The Data Application Unit (DAU) of the CMW500 was used to simulate the IP Multimedia Subsystem (IMS) server.

Test Setup for VoLTE over IMS Volume Control Measurements

2. Audio Level Settings

According to ANSI/TIA-5050-2018, the appropriate audio level to be used for VoWIFI over IMS Volume Control testing is -20dBm0 (ASL) and shall be used for the normal speech input level. The CMW500 base station simulator was manually configured to ensure that the settings for speech input and full scale levels resulted in the -20dBm0 (ASL) speech input level to the DUT for the VoWIFI over IMS connection.

II. DUT Configuration for VoWIFI over IMS Volume Control Testing

1. IEEE Standard Configuration

An investigation was performed to ensure the IEEE standard used for testing does not substantially affect the measurement results. The effects of IEEE standard were found to be independent of WIFI data rate; therefore, only one data rate was used for each IEEE standard in this investigation. IEEE 802.11b was used as the default testing configuration for the handset given the results of this investigation. See below table for comparison between different radio configurations:

| | | | | | | | | | ···· . | | | | | | | |

9. INTERIM WAIVER DA 23-914

- I. Under the waiver, only CMRS narrowband and CMRS wideband voice codecs are required to comply with the volume control requirements of the TIA 5050-2018 Volume Control Standard as amended as follows:
 - a. For the 2N mounting force test, one narrowband and one wideband voice codec embedded with the handset must pass with at least one volume control setting with a conversational gain of ≥ 6 dB for all voice services, bands of operation and air interfaces over which it operates using one codec bit rate of the applicant's choosing.
 - b. For the 8N mounting force test, one narrowband and one wideband voice codec embedded with the handset must pass with at least one volume control setting with a conversational gain of ≥ 6 dB for all voice services, bands of operation and air interfaces over which they operate but is not required to meet or exceed the full 18 dB of conversational gain specified in section 5.1.1 of the TIA 5050 Volume Control Standard using one codec bit rate of the applicant's choosing.
- II. For all other narrowband and wideband codecs not evaluated in I.a. above, TIA 5050-2018 Receive Distortion and Noise Performance and Receive Acoustic Frequency Response Performance evaluations are not required; however, these codecs shall be assessed for conversational gain and documented in the test report at the 2N and 8N levels with a gain of ≥ 6 dB for all voice services, bands of operation and air interfaces over which they operate. The handset volume setting used to comply with I.a. shall be used for these other CMRS codec evaluations.
- III. Any other codec for voice services embedded in the handset, not identified in sections I and II above are not required to comply or demonstrate in the test reports for conversational gain.
- IV. Under the waiver, the manufacturer has chosen NB EVS 24.4kbps and WB EVS 128kbps audio codec bitrates for full evaluation.

II. Test Notes

A. General

- 1. Phone Condition: Phone Condition: Mute off; Backlight off; Max Volume -1; Max Contrast
- 2. Test Signal: IEEE Std 269 uncompressed real male speech
- 3. Hearing Aid Mode was set according to the following menu path: (Phone→Call Settings→Other call Settings→Hearing aids) was set to ON for HAC compliance.
- 4. Bluetooth and WIFI were disabled while testing 2G/3G/4G/5G modes.
- 5. WD was evaluated with one volume notch down from MAX volume setting for HAC compliance.
- 6. The FCC Margin from Limit column indicates a margin from the FCC limit for compliance.

B. GSM

- 1. Power Configuration: GSM850: PCL=0;
- 2. Vocoder Configuration: EFR (GSM): FR V1, FR V2, HR V1

C. UMTS

- 1. Power Configuration: TPC = "All 1's"
- 2. Vocoder Configuration:
 - a. AMR-NB: 4.75kbps, 12.2kbps
 - b. AMR-WB: 6.60kbps,12.65kbps, 23.85kbps

D. Voice over LTE

- 1. Power Configuration: TPC = "Max Power"
- 2. Radio Configuration: 16QAM, 1RB, 0RB offset
- 3. Vocoder Configuration:
 - a. AMR-NB: 4.75kbps, 12.2kbps
 - b. AMR-WB: 6.60kbps, 12.65kbps, 23.85kbps
 - c. EVS-NB: 5.9kbps,13.2kbps, 24.4kbps
 - d. EVS-WB: 5.9kbps, 13.2kbps, 128kbps
 - e. AMR-WB: 6.60kbps,12.65kbps, 23.85kbps

E. Voice over NR

- 1. Power Configuration: TPC = "Max Power"
- 2. Radio Configuration: DFT-s-OFDM, 16QAM, 1RB, 1RB offset
- 3. Vocoder Configuration:
 - a. AMR-NB: 4.75kbps, 12.2kbps
 - b. AMR-WB: 6.60kbps, 12.65kbps, 23.85kbps
 - c. EVS-NB: 5.9kbps,13.2kbps, 24.4kbps
 - d. EVS-WB: 5.9kbps,13.2kbps, 128kbps
 - e. AMR-WB: 6.60kbps,12.65kbps, 23.85kbps
- F. Voice over WIFI
 - 1. Radio Configuration: IEEE 802.11b: DSSS, 1Mbps
 - 2. Vocoder Configuration:
 - a. AMR-NB: 4.75kbps, 12.2kbps
 - b. AMR-WB: 6.60kbps, 12.65kbps, 23.85kbps
 - c. EVS-NB: 5.9kbps,13.2kbps, 24.4kbps
 - d. EVS-WB: 5.9kbps,13.2kbps, 128kbps
 - e. AMR-WB: 6.60kbps,12.65kbps, 23.85kbps

11. MEASUREMENT UNCERTAINTY

| Receive Volume Control Requirement | Expanded uncertainty (k=2), 95% confidence level (dB) |
|------------------------------------|---|
| Conversational Gain | 0.33 |
| Frequency Response (FF) | 0.23 |
| Frequency Response (DF) | 0.19 |
| Distortion | 0.81 |

Table 11-1 Uncertainty Estimation Table

Notes:

1. Test equipment is calibrated according to techniques outlined in NIS81, NIS3003 and NIST Tech Note 1297.

 All equipment has traceability according to NIST. Measurement Uncertainties are defined in further detail in NIS 81 and NIST Tech Note 1297 and UKAS M3003.

Measurement uncertainty reflects the quality and accuracy of a measured result as compared to the true value. Such statements are generally required when stating results of measurements so that it is clear to the intended audience that the results may differ when reproduced by different facilities. Measurement results vary due to the measurement uncertainty of the instrumentation, measurement technique, and test engineer. Most uncertainties are calculated using the tolerances of the instrumentation used in the measurement setup variability, and the technique used in performing the test. While not generally included, the variability of the equipment uncertainty is based on the variability of repeated measurements (so-called Type A uncertainty). This may mean that the Hearing Aid compatibility tests may have to be repeated by taking down the test setup and resetting it up so that there are a statistically significant number of repeat measurements to identify the measurement uncertainty. The above uncertainties were estimated experimentally using the techniques contained in NIS 81 and NIS 3003.

The Hottinger Brüel and Kjær Inc. Service Center is Certified to ISO 9001:2015

CERTIFICATE OF CALIBRATION No.: CAS-565027-G1J7F1-101

Calibration Of:

Model Number : 4128-C-001

Serial Number: 1947220

Customer:

PCTEST Engineering Laboratory Inc 7185 Oakland Mills Road Columbia, MD 21046

5/6/2022

CALIBRATION CONDITIONS:

Environment conditions

| Air temperature : | 23 | °C |
|--------------------|------|-----|
| Air pressure: | 97.3 | kPa |
| Relative Humidity: | 32 | %RH |

SPECIFICATIONS:

This document certifies that the instrument as listed under "Model Number" has been calibrated and unless otherwise indicated under "Final Data", meets acceptance criteria as prescribed by the referenced Procedure, Statements of compliance, where applicable, are based on calibration results falling within specified criteria with no reduction by the uncertainty of the measurements. The calibration of the listed instrumentation was accomplished using a test system which conforms with the requirements of ISO/IEC 17025, ANSI/NCSL Z540-1, and guidelines of ISO 10012-1. For "as received" and "final" data, see the attached page(s). This Certificate and attached data pages shall not be reproduced, except in full, without written approval of the Hottinger Bruel and Kjaer Inc. Calibration Laboratory-Duluth, GA. Results relate only to the items tested. The Instrumentation has been calibrated using Measurement Standards with values traceable to the National Institute of Standards and Technology, National Measurement Institutes or derived from natural physical constants.

PROCEDURE:

The calibration was performed according to procedure number: 4128 DP Rev. 7.21

RESULTS:

"As Received" Physical Condition: Acceptable for Calibration

"As Received" Data: "As Received" = "Final Data"

"Final Data": Within Acceptance Criteria

The reported expanded uncertainty is based on the standard uncertainty multiplied by a coverage factor k=2 providing a level of confidence of approximately 95%. The uncertainty evaluation has been carried out in accordance with EA-4/02 from elements originating from standards, calibration method, effect of environmental conditions and any short term contribution from the device under calibration.

During the calibration the calibrator has been loaded by the load volume of the Transfer Microphone. The load volumes

For Bruel & Kjær Pistonphones types 4220 and 4228 the result of the SPL calibration has been corrected to be valid for a load volume of 1333 mm³. For all other types the result is valid with the actual load volume.

| Transfer | Fulfils standard | Fulfils standard | Load Volume 1" | Load Volume 1/2" |
|-----------------|------------------|------------------|------------------------------|---------------------|
| Microphone Type | IEC 61094-1 LS | IEC 61094-4 WS | (1/2" mic including DP-0776) | |

15. CONCLUSION

The measurements indicate that the wireless communications device complies with the HAC limits specified in accordance with the ANSI C63.19 Standard and FCC WT Docket No. 01-309 RM-8658. Precise laboratory measures were taken to assure repeatability of the tests. The tested device complies with the requirements in respect to all parameters specific to the test. The test results and statements relate only to the item(s) tested.

The measurement system and techniques presented in this evaluation are proposed in the ANSI standard as a means of best approximating wireless device compatibility with a hearing-aid. The literature is under continual re-construction.
