The following is the RF exposure calculation for the NextNav, LLC Metropolitan Beacon System (MBS). The MBS is a radio device intended to be used in a fixed or mobile locations – at least more than 20 cm from the user or nearby person.

The calculation is based on FCC 47CFR 1.1310 and OET 65. Per FCC sec 1.1310:

Maximum Permissible Exposure (MPE) **for General Population/Uncontrolled Exposure** in the frequency range 300-1500 MHz is:

Freq. (MHz)/1500 = MPE 
$$mW/cm^2$$

For the Frequencies from 920.7 MHz to 928.0 MHz, the worst case MPE =  $920.7 / 1500 = 0.614 \text{ mW/cm}^2 = 6.14 \text{ W/m}^2$ 

The following equations determine the distance from the antenna that the Power Density (S) is:  $S \le 6.14 \text{ W/m}^2$ .

The Maximum ERP is 30 W (adjusted for any antenna used), and EIRP is 49.2 W.

**Power Density** 

$$S = (EIRP) / (4 \times \pi \times D^2)$$
 (1)

Minimum distance

$$\mathbf{D} \ge \sqrt{\left(\mathbf{EIRP}\right) / \left(4 \times \pi \times \mathbf{S}\right)} \tag{2}$$

From (2)

$$D \ge \sqrt{49.2 / (4 \times \pi \times 6.14)} = 0.8 \text{ m}$$

The following statement is added to the installation/operation manual:

To comply with Maximum Permissible Exposure (MPE) requirements the antenna must be permanently installed in a fixed location that provides at least 1 meters of separation from all persons.
