

FCC Test Report

Report No.: RF190315C04 R5

FCC ID: A4RG020I

Test Model: G0201

Received Date: Mar. 15, 2019

Test Date: May 27 to June 17, 2019

Issued Date: July 06, 2019

Applicant: Google LLC

Address: 1600 Amphitheatre Parkway, Mountain View, CA 94043, USA

Issued By: Bureau Veritas Consumer Products Services (H.K.) Ltd., Taoyuan Branch

Hsin Chu Laboratory

Lab Address: E-2, No.1, Li Hsin 1st Road, Hsinchu Science Park, Hsinchu City 300,

Taiwan R.O.C.

Test Location: E-2, No.1, Li Hsin 1st Road, Hsinchu Science Park, Hsinchu City 300,

Taiwan R.O.C.

FCC Registration / Designation Number:

723255 / TW2022

This report is for your exclusive use. Any copying or replication of this report to or for any other person or entity, or use of our name or trademark, is permitted only with our prior written permission. This report sets forth our findings solely with respect to the test samples identified herein. The results set forth in this report are not indicative or representative of the quality or characteristics of the lot from which a test sample was taken or any similar or identical product unless specifically and expressly noted. Our report includes all of the tests requested by you and the results thereof based upon the information that you provided to us. You have 60 days from date of issuance of this report to notify us of any material error or omission caused by our negligence, provided, however, that such notice shall be in writing and shall specifically address the issue you wish to raise. A failure to raise such issue within the prescribed time shall constitute your unqualified acceptance of the completeness of this report, the tests conducted and the correctness of the report contents. Unless specific mention, the uncertainty of measurement has been explicitly taken into account to declare the compliance or non-compliance to the specification. The report must not be used by the client to claim product certification, approval, or endorsement by TAF or any government agencies.

Report No.: RF190315C04 R5 Page No. 1 / 56 Report Format Version: 6.1.1 Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

1 Certificate of Conformity

Product: Phone

Test Model: G0201

Sample Status: EVT

Applicant: Google LLC

Test Date: May 27 to June 17, 2019

Standards: 47 CFR FCC Part 15, Subpart C (Section 15.255) as referenced by FCC DA 18-

1308

ANSI C63.10: 2013

The above equipment has been tested by **Bureau Veritas Consumer Products Services (H.K.) Ltd., Taoyuan Branch**, and found compliance with the requirement of the above standards. The test record, data evaluation & Equipment Under Test (EUT) configurations represented herein are true and accurate accounts of the measurements of the sample's EMC characteristics under the conditions specified in this report.

Prepared by: Many, Date: July 06, 2019

Phoenix Huang / Specialist

Approved by : , **Date:** July 06, 2019

Wen Yu / Supervisor

2 Summary of Test Results

Standard	Test Items	Limit	Test Procedure	Note	Remarks
§15.255 (f) /FCC Waiver			ANSI 63.10		Meet the requirement of limit.
§15.255 (f)	Frequency Stability	57 -64 GHz	ANSI 63.10	Extreme Temperature: -20, +50 °C	Meet the requirement of limit.
§15.255 (e)	6 dB Bandwidth / OBW	Reporting Purposes Only	ANSI 63.10		Reference only.
FCC Waiver	Duty Cycle	10% within 33ms	ANSI 63.10		Meet the requirement of limit.
FCC Waiver	Peak EIRP	13 dBm/10% duty cycle	Substitution Method		Meet the requirement of limit.
-	Average EIRP	RF Exposure Purposes	Substitution Method		Reference only.
FCC Waiver	Peak PSD	13 dBm/MHz	ANSI 63.10		Meet the requirement of limit.
§15.255 (d)(2)	30 MHz - 40 GHz Radiated Emissions	74dBuV/m for Peak 54dBuV/m for Average	ANSI 63.10		Meet the requirement of limit. Minimum passing
§15.255 (d)(3)	40 GHz - 200 GHz Radiated Emissions	90 pW/cm^2	ANSI 63.10	-10dBm EIRP at 3m	margin is -7.4dB at 39.89MHz.
§15.207	AC Line Conducted Emissions	Refer §15.207	ANSI 63.10		Meet the requirement of limit. Minimum passing margin is -14.65dB at 0.38828MHz.
§15.255 (g) /§1.1310(e)	RF Exposure	Refer §1.1310(e)	Calculation Only		See Note 2

Note:

- 1. Determining compliance based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.
- 2. The "RF Exposure" was recorded in another test report.

2.1 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

Measurement	Frequency	Expanded Uncertainty (k=2) (±)
Conducted Emissions at mains ports	150kHz ~ 30MHz	1.8 dB
Radiated Emissions up to 1 GHz	30MHz ~ 1GHz	5.1 dB
	1GHz ~ 6GHz	5.1 dB
Radiated Emissions above 1 GHz	6GHz ~ 18GHz	5.0 dB
Radiated Emissions above 1 GHz	18GHz ~ 40GHz	5.2 dB
	40GHz ~ 200GHz	5.4 dB

2.2 Modification Record

There were no modifications required for compliance.

3 General Information

3.1 General Description of EUT

Product	Phone			
Test Model	G020I			
Identification No. of EUT	934AZ06962			
Status of EUT	Normal Operating Condition			
Battery Nominal Voltage	3.85 VDC			
Battery Voltage Operation Range	3.5 – 4.4 Vdc			
Modulation Type	FMCW			
Modulation Technology	Pulse			
Transfer Rate	N/A			
Operating Frequency	58 – 63.5 GHz			
Antenna Type	Microstrip Patch ⊠ Integral □ Exrernal			
Antenna Connector	NA			
Antenna Gain	6 dBi, ⊠ Specified by manufacturer ☐ Measured			
Test sequence / test software used:	See 3.2 Description of Test Modes			
Output Power (EIRP)	11.65 dBm			
Accessory Device	Refer to Notes as below			
Data Cable Supplied	Refer to Notes as below			

1.	The above EUT information is declared by manufacturer and for more detailed features description,
	please refer to the manufacturer's specifications or user's manual.

3.2 Description of Test Modes

Test Mode	Frequency Range (GHz)	Channel	Frequency (GHz)	Duty Cycle
Mode 1	58 – 63.5	1	60.75	10%
Mode 2	58 – 63.5	1	60.75	0.12%

Note: All measurements were performed on mode 1 (highest duty cycle) as the worst case.

Test Mode Applicability and Tested Channel Detail 3.2.1

EUT		APPLICABLE TO									DESCRIPTION
CONFIGURE MODE	DC	RE≥1G	RE < 1G	PLC	6dB BW	20dB BW	FS	99% BW	OP	PSD	DESCRIPTION
1	√	√	√	√	√	√	√	√	\checkmark	√	Duty Cycle 10%
2	√	-	-	-	-	-	-	-	-	-	Duty Cycle 0.12%

Where DC: Duty Cycle

RE ≥ 1G: Radiated Emission above 1GHz RE < 1G: Radiated Emission below 1GHz **PLC:** Power Line Conducted Emission

6dB BW: 6dB Bandwidth 20dB BW 20dB Bandwidth FS: Frequency Stability 99% BW: 99% Bandwidth **OP:** Output Power **PSD:** Power Spectral Density

Note: The EUT had been pre-tested on the positioned of each 3 axis. The worst case was found when positioned on Y-plane.

Duty Cycle Test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode Tested Mode		Modulation Technology	Modulation Type
1	1	Pulse	FMCW
2	1	Pulse	FMCW

Radiated Emission Test (Above 1GHz):

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Available Mode Tested Mode		Modulation Type
1	1	Pulse	FMCW

Radiated Emission Test (Below 1GHz):

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

Power Line Conducted Emission Test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

Report No.: RF190315C04 R5 Page No. 9 / 56 Report Format Version: 6.1.1

Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

6dB Bandwidth Test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type	
1	1	Pulse	FMCW	

20dB Bandwidth test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

Frequency stability test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

99% Bandwidth Test:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

Output Power Measurement:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type
1	1	Pulse	FMCW

Report No.: RF190315C04 R5 Page No. 10 / 56 Report Format Version: 6.1.1

Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

Power Spectral Density Measurement:

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Following channel(s) was (were) selected for the final test as listed below.

Available Mode	Tested Mode	Modulation Technology	Modulation Type	
1	1	Pulse	FMCW	

Test Condition:

3.4 **General Description of Applied Standards** The EUT is a RF Product. According to the specifications of the manufacturer, it must comply with the requirements of the following standards: FCC Part 15, Subpart C (15.255) as referenced by FCC DA 18-1308 ANSI C63.10-2013 All test items have been performed and recorded as per the above standards.

Report No.: RF190315C04 R5 Page No. 13 / 56 Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

3.5 Test Instruments

For Power Line Conducted Emission Test:

DESCRIPTION & MANUFACTURER	MODEL NO.	SERIAL NO.	CALIBRATED DATE	CALIBRATED UNTIL
Test Receiver R&S	ESCS 30	847124/029	Oct. 24, 2018	Oct. 23, 2019
Line-Impedance Stabilization Network (for EUT) R&S	ESH3-Z5	848773/004	Oct. 22, 2018	Oct. 21, 2019
Line-Impedance Stabilization Network (for Peripheral) R&S	ESH3-Z5	835239/001	Mar. 17, 2019	Mar. 16, 2020
50 ohms Terminator	N/A	3	Oct. 22, 2018	Oct. 21, 2019
RF Cable	5D-FB	COCCAB-001	Sep. 28, 2018	Sep. 27, 2019
Fixed attenuator EMCI	STI02-2200-10	003	Mar. 14, 2019	Mar. 13, 2020
Software BVADT	BVADT_Cond_ V7.3.7.4	NA	NA	NA

- 1. The calibration interval of the above test instruments are 12 months and the calibrations are traceable to NML/ROC and NIST/USA.
- 2. The test was performed in Conduction 1.
- 3 Tested Date: May 27, 2019

For Other Test (30MHz ~ 18GHz):

Description & Manufacturer	Model No.	Serial No.	Cal. Date	Cal. Due

4 Test Types and Results

4.1 Duty Cycle Measurement

4.1.1 Applicable Rule and Limits of Duty Cycle Measurement

Per paragraph 14 of the associated waiver, FCC DA 18-1308, the device shall operate with a maximum transmit duty cycle of 10 percent in any 33 milliseconds (ms) interval.

4.1.2 Test Procedures

The spectrum analyzer and external mixer are set up to measure the radiated output of the transmitter.

4.1.3 Deviation from Test Standard

No deviation.

4.1.4 Test Setup

4.1.5 EUT Operating Conditions

The software provided by client to enable the EUT under transmission condition continuously at specific channel frequencies individually.

Report No.: RF190315C04 R5 Page No. 19 / 56 Report Format Version: 6.1.1

4.1.6 Test Results (Mode 1)

Maximum ON Time in any 33 ms observation period = (30 chirps) * (108.6 us/chirp) = 3.258 ms Maximum Limit = 3.3 ms PASS

4.1.7 Test Results (Mode 2)

Minimum ON Time in any 33 ms observation period = (8 chirps) * (35.8 us/chirp) = 0.2864 ms Minimum Limit = 0.033 ms

PASS

4.2 Output Power Measurement

4.2.1 Limits of Output Power Measurement

Per paragraph 14 of the associated waiver, FCC DA 18-1308, the device shall be certified for compliance with all the technical specifications applicable to operation under 47 CFR. Part 15, with the exception of the following provisions in: 1) 47 CFR § 15.255(c)(3), which is waived to allow the device to operate in the 57-64 GHz band at a maximum +13 dBm EIRP, +10 dBm transmitter conducted output power, and +13 dBm/MHz power spectral density;...

Limit

- +13 dBm EIRP
- +10 dBm conducted output power

4.2.2 Test Setup

4.2.3 Test Procedures

- a. Place the EUT in a continuous transmission mode.
- b. For radiated emission measurements, attach a test receive antenna for the fundamental frequency band to the RF input of an RF detector or a downconverter with an RF detector at the output.
- c. Connect the video output of the detector to the 50 ohm input of the DSO.
- d. Place the test receive antenna in the main beam of the EUT at a distance which will provide a signal within the operating range of the RF detector.
- e. Set the sampling rate of the DSO to the required value. Adjust the memory depth, the triggering and the sweep speed to obtain a display which is representative of the signal considering the type of modulation.
- f. For radiated emission measurements, calculate the distance to the far field boundary of the fundamental emission using following equation

$$d_{\textit{farfield}} = \frac{2D^2}{\lambda}$$

where:

D = largest dimension of the transmit antenna

 $\lambda = wavelength$

Tx patch antenna

Frequency (GHz)	L (m)	Lambda (m)	R (Far Field) (m)
58	0.00233	0.0052	0.0021
63.5	0.00233	0.0047	0.0023

Rx horn antenna

Frequency (GHz)	L (m)	Lambda (m)	R (Far Field) (m)
58	0.025	0.0052	0.2404
63.5	0.025	0.0047	0.266

- g. Perform radiated emission measurements to keep maximize the received signal from the EUT in the far field.
- h. Record the average and peak from the DSO and the measurement distance.
- i. Disconnect the EUT from the RF input port of the instrumentation system.
- j. Connect a mm-wave source to the RF input port of the instrumentation system via a waveguide variable attenuator. The mm-wave source is unmodulated.
- k. Using substitution measurement.
- I. Measure and note the power.
- m. For conducted power measurements, calculate the conducted power using following equation

$$P_{cond} = EIRP-G_{dBi}$$

4.2.4 Deviation from Test Standard

No deviation.

4.2.5 EUT Operating Conditions

Same as Item 4.1.5.

4.2.6 Test Results

For Peak Power

Channel	Frequency (GHz)	Transmit Antenna	S.G Output Value (dBm)	EIRP (dBm)	EIRP Limit (dBm)	Pass /Fail
1	60.75	24	-12.35	11.65	13	Pass

For Peak Conducted Power

Channel	Frequency (GHz)	EIRP (dBm)	EUT Transmit Antenna Gain (dBi)		Conducted Output Power limit (dBm)	Pass /Fail
1	60.75	11.65	6	5.65	10	Pass

For Average Power

Channel	Frequency (GHz)	EIRP (dBm)
1	60.75	1.65

Note:

1. The EIRP was evaluated on vertical and horizontal polarization, the worst case is Vertical polarization.

2. Average power = Peak power - 10*log(1/duty cycle).

4.3 Radiated Emission Measurement

4.3.1 Limits of Radiated Emission Measurement

Spurious Emission						
Frequency Range	Limitation					
Radiated emissions below 40GHz	Part 15.209					
Between 40GHz and 200GHz	90pW/cm ² (at 3 meter)					
Note: The levels of the spurious emissions shall not exceed the level of the fundamental emission						

Emissions radiated outside of the specified bands, shall be according to the general radiated limits in 15.209 as following:

Frequencies (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

- 1. The lower limit shall apply at the transition frequencies.
- 2. Emission level $(dBuV/m) = 20 \log Emission level (uV/m)$.
- 3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.
- 4. Section 15.205 restricted bands of operation shall compliance with the limits in Section 15.209.

4.3.2 Test Procedures

For Radiated emission below 30MHz

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter chamber room. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. Parallel, perpendicular, and ground-parallel orientations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Quasi-Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

Note:

 The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 9kHz at frequency below 30MHz.

For Radiated emission 30MHz to 40GHz

- a. The EUT was placed on the top of a rotating table 0.8 meters (for 30MHz ~ 1GHz) / 1.5 meters (for above 1GHz) above the ground at 3 meter chamber room for test. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters (30MHz-18GHz) / 1 meters (18GHz-40GHz) away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The height of antenna is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to quasi-peak detect function and specified bandwidth with maximum hold mode when the test frequency is below 1 GHz.
- f. The test-receiver system was set to peak and average detects function and specified bandwidth with maximum hold mode when the test frequency is above 1 GHz. If the peak reading value also meets average limit, measurement with the average detector is unnecessary.

Note:

- The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 120kHz for Quasipeak detection (QP) at frequency below 1GHz.
- The resolution bandwidth of test receiver/spectrum analyzer is 1 MHz and the video bandwidth is 3 MHz for Peak detection (PK) and Average detection (AV) at frequency above 1GHz.
- 3. All modes of operation were investigated and the worst-case emissions are reported.

Report No.: RF190315C04 R5 Page No. 26 / 56 Report Format Version: 6.1.1

Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

For Radiated emission above 40GHz

- Connect the test antenna covering the appropriate frequency range to a spectrum analyzer via an external mixer to the spectrum analyzer.
- b. Set spectrum analyzer RBW = 1 MHz, VBW = 3 MHz, average detector.
- c. Calculate the distance to the far field boundary and determine the maximum measurement distance.
- d. Perform an exploratory search for emissions and determine the approximate direction at which each observed emission emanates from the EUT.
- e. Exploratory measurements be made at a closer distance than the validated maximum measurement distance.
- f. Perform a final measurement; begin with the test antenna at the approximate position where the maximum level occurred during the exploratory scan.
- g. Slowly scan the test antenna around this position, slowly vary the test antenna polarization by rotating through at least 0° to 180°, and slowly vary the orientation of the test antenna to find the final position, polarization, and orientation at which the maximum level of the emission is observed.
- h. Record the measured reading with the test antenna fixed at this maximized position, polarization, and orientation. Record the measurement distance.
- i. Calculate the maximum field strength of the emission at the measurement distance and the adjusted/corrected power at the output of the test antenna.
- j. Calculate the EIRP from the measured field strength and then convert to the linear.
- k. Calculate the power density at the distance specified by the limit from the field strength at the distance specified by the limit.
- I. Repeat the preceding sequence for every emission observed in the frequency band under investigation.

433	Deviation	fram	Taat	Ctondord
4.3.3	Devianon	11()[[Test	Siandard

No deviation.

REMARKS:

- 1. Emission Level(dBuV/m) = Raw Value(dBuV) + Correction Factor(dB/m)
- 2. Correction Factor(dB/m) = Antenna Factor(dB/m) + Cable Factor(dB) Pre-Amplifier Factor(dB)
- 3. The other emission levels were very low against the limit.
- 4. Margin value = Emission Level Limit value
- 5. Shorter measurement distances was used to improve the measurement system's noise floor. As standard description is based on the measurement in distance of 3 meters, the data obtained at 1-meter distance was extrapolate results to the 3-m distance:

Test value at 3-meter distance (dBuV)

- = Test value at 1 meter distance (dBuV) -20log(3/1)(dB)
- = Test value at 1 meter distance (dBuV) -9.54(dB).

^{*}Measurements made at 1 meter distance. Test value converted to account for 3-meter measurement distance.

Report Format Version: 6.1.1

For above 40GHz

CHANNEL	TX Channel 1	DETECTOR	Average (AV)
FREQUENCY RANGE	40GHz ~ 200GHz	FUNCTION	Average (AV)

	ANTENNA POLARITY: HORIZONTAL								
NO.	Frequency (GHz)	EIRP Level (dBm)	S.G Output Value (dBm)	Transmit Antenna Gain (dBi)	Power Density (pW/cm²)	Power Density Limit (pW/cm²)	Margin (pW/cm²)		
1	43.67	-60.94	-84.94	24	0.001	90	-89.999		
2	120.048	-45.13	-68.93	23.8	0.027	90	-89.973		
3	199.25	-52.10	-76.20	24.1	0.005	90	-89.995		
		ANT	ENNA POLA	RITY: VERT	ICAL				
NO.	Frequency (GHz)	EIRP Level (dBm)	S.G Output Value (dBm)	Transmit Antenna Gain (dBi)	Power Density (pW/cm²)	Power Density Limit (pW/cm²)	Margin (pW/cm²)		
1	43.41	-62.30	-85.30	24	0.001	90	-89.999		
2	120.014	-46.30	-70.10	23.8	0.021	90	-89.979		
3	198.23	-53.20	-77.30	24.1	0.004	90	-89.996		

Note:

1. The measured power level is converted to EIRP using the Friis equation:

 $EIRP = P_{cond} + G_{EUT} = P_{SG} + G_{transmit}$

where:

P_{cond} is the EUT conducted power

G_{EUT} is the EUT antenna gain

 P_{SG} is the S.G output level

G_{transmit} is the transmit antenna gain

*Measurements made at 1 meter distance.

2. Power density formula as follows:

Power density = EIRP / $(4 * Pi * r^2)$

r is the standard distance at 3 meter

3. The far-field boundary is given in ANSI 63.10 as:

R far field = $(2 * L^2)/\lambda$

L is the Largest Antenna Dimension, including the reflector

 λ is the wavelength

4.4 Conducted Emission Measurement

4.4.1 Limits of Conducted Emission Measurement

- (111)	Conducted Limit (dBuV)				
Frequency (MHz)	Quasi-peak	Average			
0.15 - 0.5	66 - 56	56 - 46			
0.50 - 5.0	56	46			
5.0 - 30.0	60	50			

Note: 1. The lower limit shall apply at the transition frequencies.

2. The limit decreases in line with the logarithm of the frequency in the range of 0.15 to 0.50MHz.

4.4.2 Test Procedures

- a. The EUT was placed 0.4 meters from the conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). Other support units were connected to the power mains through another LISN. The two LISNs provide 50 ohm/ 50uH of coupling impedance for the measuring instrument.
- b. Both lines of the power mains connected to the EUT were checked for maximum conducted interference.
- c. The frequency range from 150kHz to 30MHz was searched. Emission levels under (Limit 20dB) was not recorded.

Note: The resolution bandwidth and video bandwidth of test receiver is 9kHz for quasi-peak detection (QP) and average detection (AV) at frequency 0.15MHz-30MHz.

4.4.3 Deviation from Test Standard

No deviation.

4.4.4 Test Setup

Note: 1.Support units were connected to second LISN.

For the actual test configuration, please refer to the attached file (Test Setup Photo).

4.4.5 EUT Operating Conditions

Same as 4.1.5.

4.5 6dB Bandwidth Measurement

4.5.1 Applicable Rule and Limits of 6dB Bandwidth Measurement

Applicable Rule

§15.255 (e) (1) Transmitters with an emission bandwidth of less than 100 MHz must limit their peak transmitter conducted output power to the product of 500 mW times their emission bandwidth divided by 100 MHz. For the purposes of this paragraph, emission bandwidth is defined as the instantaneous frequency range occupied by a steady state radiated signal with modulation, outside which the radiated power spectral density never exceeds 6 dB below the maximum radiated power spectral density in the band, as measured with a 100 kHz resolution bandwidth spectrum analyzer. The center frequency must be stationary during the measurement interval, even if not stationary during normal operation (e.g., for frequency hopping devices).

Limit

None: For reporting purposes only.

4.5.2 Test Setup

4.5.3 Test Procedure

The spectrum analyzer and external mixer are set up to measure the radiated output of the transmitter.

4.5.4 Deviation from Test Standard

No deviation.

4.5.5 EUT Operating Conditions

Same as Item 4.1.5.

4.5.6 Test Result

Channel	Frequency (GHz)	6dB Bandwidth (GHz)	
1	60.75	5.591	

Report Format Version: 6.1.1

4.6 20dB Bandwidth Measurement

4.6.1 Applicable Rule and Limits of 20dB Bandwidth Measurement

Applicable Rule

§15.215 (c) Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. In the case of intentional radiators operating under the provisions of subpart E, the emission bandwidth may span across multiple contiguous frequency bands identified in that subpart. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage.

Per paragraph 14 of the associated waiver, FCC DA 18-1308, the device shall be certified for compliance with all the technical specifications applicable to operation under 47 CFR. Part 15, with the exception of the following provisions in: 1) 47 CFR § 15.255(c)(3), which is waived to allow the device to operate in the 57-64 GHz band at a maximum +13 dBm EIRP, +10 dBm transmitter conducted output power, and +13 dBm/MHz power spectral density;...

<u>Limit</u>

57 to 64 GHz

4.6.2 Test Setup

4.6.3 Test Procedure

The spectrum analyzer and external mixer are set up to measure the radiated output of the transmitter. Follow ANSI C63.10 Clauses 9.3 and 9.14

The 20 dB bandwidth is measured at the reference condition of 20 deg C and 3.85 VDC.

Report No.: RF190315C04 R5 Page No. 43 / 56

4.7 Frequency Stability Measurement

4.7.1 Applicable Rule and Limits of Frequency Stability Measurement

Applicable Rule

§15.255 (f) Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation. Equipment is presumed to operate over the temperature range -20 to +50 degrees Celsius with an input voltage variation of 85% to 115% of rated input voltage, unless justification is presented to demonstrate otherwise.

Per paragraph 14 of the associated waiver, FCC DA 18-1308, the device shall be certified for compliance with all the technical specifications applicable to operation under 47 CFR. Part 15, with the exception of the following provisions in: 1) 47 CFR § 15.255(c)(3), which is waived to allow the device to operate in the 57-64 GHz band at a maximum +13 dBm EIRP, +10 dBm transmitter conducted output power, and +13 dBm/MHz power spectral density;...

Limit

57 to 64 GHz

4.7.2 Test Setup

Report No.: RF190315C04 R5 Page No. 46 / 56 Report Format Version: 6.1.1

4.7.3 Test Procedure

The EUT is then placed in an environmental chamber and set to operate in a CW mode, with power furnished by an adjustable source. The carrier frequency is counted at each extreme condition and compared with the reference condition.

- a. Arrange EUT and test equipment as above setup configuration.
- b. With the EUT at ambient temperature and voltage source set to the EUT nominal operating voltage (100%), record the spectrum mask of the EUT emission on the spectrum analyzer.
- c. Vary EUT power supply between 85% and 115% of nominal, and record the frequency excursion of the EUT emission mask.
- d. Set the power supply to 100% nominal setting, and raise EUT operating temperature to 50 °C. Record the frequency excursion of the EUT emission mask.
- e. Repeat step d) at each 10 °C increment down to -20 °C

No deviation.

4.7.5 EUT Operating Conditions

Report No.: RF190315C04 R5 Page No. 51 / 56 Cancels and replaces the report No.: RF190315C04 R4 dated July 05, 2019

4.9.3 Test Procedures

ANSI C63.10 Clause 9.10

The fundamental signal is measured in far-field condition using a Standard Gain Horn Antenna, Low Noise Amplifier, Downconverter and Spectrum Analyzer (PXA).

Spectrum analyzer peak detector measurements are corrected for the decreased sensitivity that results when a CW signal is swept through the RBW filter at a high rate compared to the bandwidth squared.

The derivation of the FMCW Desensitization Factor is given in Keysight Application Note 5952-1039 Appendix B.

$$\alpha = \frac{1}{\sqrt{1 + \left(\frac{2\ln(2)}{\pi}\right)^2 \left(\frac{F_s}{T_s B^2}\right)^2}}$$

and

FMCW Desensitization Factor = $20 \text{ Log}(\alpha)$

Where

F_s = FMCW Sweep Width or Chirp Width

T_s = FMCW Sweep Time

B = 3-dB bandwidth of Gaussian RBW Filter

4.9.4 Deviation from Test Standard

No deviation.

4.9.5 EUT Operating Conditions

Same as Item 4.1.5.

4.9.6 Offset Calculation

Follow FCC KDB 412172 Determining ERP and ERIP DR01

EIRP = Pr + Lp

Pr = Pmeas - Gr + Lc + Latten - Gamp

Lp = 20log(f) + 20log(d) - 27.5

EIRP = Pmeas - Gr + Lc + Latten - Gamp + 20log(f) + 20log(d) - 27.5

Pmeas: Raw Reading for The Measurement (dBm)

Gr: Receiver Antenna Gain (dBi)

Lc: Cable Loss (dB)

Latten: Attenuation Loss (dB) Gamp: Amplifier Gain (dB)

The Offset Value at 61.048 GHz:

Gr (dBi)	Lc (dB)	Latten (dB)	Gamp (dB)	f (MHz)	d (m)	Desensitization Factor (dB)	Offset (dB)
21	7.23	0	0	61048	1	13.5	67.94

FMCW Desensitization Factor for RBW = 1 MHz
