1. Introduction Section

FCC ID: A4RGB62Z (parent model) and FCC ID: A4RGX7AS (variant model) use the same printed circuit board. As such the layout is not changed and the position of components between reference model and variant model is identical.

The variant model depopulated the FR2 radio and FR2 antenna module and populated n41 (n38) PAMiD Module and its related components, which are used for the support of n41 and n38 and different tuner code at ant 1 < 1G band, details are available in the operational description. Due to the same design of the antenna 0/1/2/6, SAR data reuse is requested and spot check data in this report is used to justify the SAR data reuse.

The applicant should take full responsibility that the test data as referenced in this report represent compliance for this FCC ID: A4RGX7AS.

2. Model Difference Information

The difference between FCC ID: A4RGB62Z and FCC ID: A4RGX7AS is as below:

- Depopulated the FR2 radio and FR2 antenna module
- Different tuner code at ant 1 for LTE B5/B12/B13/B14/B17/B26/B71
- Populated n41 (n38) PAMiD Module and its related components, which are used for the support of n41 and n38

The details of similarity and difference can be found in the confidential documents.

4.4 Product Specific SAR

Table with 14 columns: No., Band, Mode, Test Position, Gap (mm), Power State, Ch., Freq. (MHz), Average Power (dBm), Tune-Up Limit (dBm), Tune-up Scaling Factor, Power Drift (dB), Measured 10g SAR (W/kg), Reported 10g SAR (W/kg), Deviation %. It contains 28 rows of test data for various antenna configurations and modulation schemes.

Conclusion:

The spot check results don't show the SAR increase more than 30%, and all below 1.2W/kg for 1-g SAR, below 3W/kg for 10-g SAR. Referring to the guidance in the KDB inquiry, SAR data reuse is justified.

5. System Verification

5.1 Tissue Verification

The tissue dielectric parameters of tissue-equivalent media used for SAR measurements must be characterized within a temperature range of 18°C to 25°C, measured with calibrated instruments and apparatuses, such as network analyzers and temperature probes. The temperature of the tissue-equivalent medium during SAR measurement must also be within 18°C to 25°C and within ± 2°C of the temperature when the tissue parameters are characterized. The tissue dielectric measurement system must be calibrated before use. The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements.

The liquid tissue depth was at least 15cm in the phantom for all SAR testing.

5.2 System Performance Check Results

Comparing to the original SAR value provided by SPEAG, the verification data should be within its specification of 10 %. Below table shows the target SAR and measured SAR after normalized to 1W input power. The table below indicates the system performance check can meet the variation criterion.

General Note:

1. Prior to system verification and validation, the path loss from the signal generator to the system check source and the power meter, which includes the amplifier, cable, attenuator and directional coupler, was measured by the network analyzer. The reading of the power meter was offset by the path loss difference between the path to the power meter and the path to the system check source to monitor the actual power level fed to the system check source.
2. The dipole calibration interval can be extended to 3 years with justification according to KDB 865664 D01. The dipoles are also not physically damaged, or repaired during the interval. The justification data in appendix C can be found which the return loss is < -20dB, within 20% of prior calibration, the impedance is within 5 ohm of prior calibration for each dipole.
