ATTACHMENT H --- MEASUREMENT OF THE UHF NOISE FIGURES ON BULLETIN OST MP-2 AND STATISTICAL PLAN.

1. Measurements of TV Tuner Noise Figure

This documents is the material of UHF TV Receiver Noise Figure measurement.

1) Measurements Procedure.(ON BULLETIN OST MP-2 JULY 1982)

- a. The measurements of noise figures are made in a shielded room.
- b. Before testing, the television receiver and Noise figure test equipment are to be subjected to a warm-up period of sufficient time for stabilization of factors which could affect the measurements.
- c. Automatic Gain Control bias, preceding the noise output measurement point, is maintained at the level(4.0V) existing When there is no input signal with the receivers UHF input terminated in its nominal impedance(75 ohm).
- d. It must first be ascertained that the noise figure contribution of the I.F. amplifier following the measuring point not exceed 0.3dB.

If the influence of the 2nd stage is $\Delta F(\text{dB})$, then

$$\Delta F(\text{dB}) = 10 \cdot \log_{10} \left[1 + \frac{F2 - 1}{G1F1} \right] \quad \text{is given}$$

so that Tuner Gain : $G1 = 39 \text{ dB}(\text{typical})$ then the influence of the 2nd stage is to be less than 0.3dB so that influence of the 2nd stage can be ignored.

- e. N.F. Value = Meter Reading --- Balun Insertion loss

Balun Insertion loss is mentioned in ATTACHMENT H-4. Therefor, it can get noise figures of UHF Tuner by correcting Factors of this value.

 Meter Reading : 17.7 dBμV/50Ω
 Correction Factor : 2.0 dB

Then, the output signal level is calculated as follows.

$$\text{Signal Level} = 17.7 + 2.0 = 19.7 \text{ dB}\mu\text{V}/75\Omega$$

[Summary of Test Results]

Minimum margin was 19.2 dB at 122.47 MHz, test channel #3.

ENGINEERING TEST REPORT**7. Transfer Switch Measurement****7.1 Test Procedure**

(1) Configure the EUT System in accordance with ANSI C63.4-1992 section 12.2.

☒ : without deviation, ☐ : with deviation(details are found below)

See also the block diagram and the photographs of EUT System configuration in this report.

(2) Unused RF input/output terminals are terminated in the proper impedance.

(3) Activate the EUT system.

(4) Set the spectrum analyzer as follows.

Frequency Span	: 1 MHz
Resolution bandwidth	: 100 kHz
Video bandwidth	: 3 MHz
Detector function	: Peak mode

(5) The antenna input terminal is connected to the input of pre-amplifier through the matching transformer with a calibrated 50 Ω coaxial cable. And the output of pre-amplifier is connected to the spectrum analyzer.

(6) Then, the signal level on the antenna input terminal is measured under the EUT condition produced the maximum signal level.
