

## **CERTIFICATION TEST REPORT**

## Report Number. : R12570795-E2

- Applicant : Bose Corporation 100 The Mountain Framingham, MA 01701, USA
  - Model : 423352
  - FCC ID : A94423352
    - **IC** : 3232A-423352
- **EUT Description** : Wireless Headset
- Test Standard(s) : FCC 47 CFR PART 15 SUBPART C ISED RSS-247 ISSUE 2 ISED RSS-GEN ISSUE 5

Date Of Issue: January 29, 2019

Prepared by: UL LLC 12 Laboratory Dr. Research Triangle Park, NC 27709 U.S.A. TEL: (919) 549-1400

UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. government.

Approved & Released For UL LLC By:

UL LLC

Jeffrey Moser Operations Leader UL – Consumer Technology Division

## 2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC CFR 47 Part 2, FCC CFR 47 Part 15, ANSI C63.10-2013, RSS-GEN Issue 5, and RSS-247 Issue 2.

## 3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 12 Laboratory Drive, Research Triangle Park, North Carolina 27709, USA and 2800 Perimeter Park Dr., Suite B, Morrisville, North Carolina 27560, USA. The following table identifies which facilities were utilized for radiated emission measurements documented in this report. Specific facilities are also identified in the test results sections.

| 12 Laboratory Dr.        | 2800 Perimeter Park Dr.      |
|--------------------------|------------------------------|
| Chamber A (ISED:2180C-1) | Chamber North (ISED:2180C-3) |
| Chamber C (ISED:2180C-2) | Chamber South (ISED:2180C-4) |

UL LLC (RTP) is accredited by NVLAP, Laboratory Code 200246-0

Page 6 of 64

## 4. CALIBRATION AND UNCERTAINTY

## 4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

## 4.2. SAMPLE CALCULATION

#### RADIATED EMISSIONS

Where relevant, the following sample calculation is provided: Field Strength (dBuV/m) = Measured Voltage (dBuV) + Antenna Factor (dB/m) + Cable Loss (dB) – Preamp Gain (dB) 36.5 dBuV + 18.7 dB/m + 0.6 dB - 26.9 dB = 28.9 dBuV/m

#### MAINS CONDUCTED EMISSIONS

Where relevant, the following sample calculation is provided: Final Voltage (dBuV) = Measured Voltage (dBuV) + Cable Loss (dB) + Limiter Factor (dB) + LISN Insertion Loss. 36.5 dBuV + 0 dB + 10.1 dB + 0 dB = 46.6 dBuV

## 4.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

| PARAMETER                           | UNCERTAINTY               |
|-------------------------------------|---------------------------|
| Radio Frequency (Spectrum Analyzer) | 141.2 Hz                  |
| Occupied Channel Bandwidth          | 2.00%                     |
| RF output power, conducted          | 1.3 dB (PK), 0.45 dB (AV) |
| RF output power, radiated (SAC)     | 4.52 dB                   |
| Power Spectral Density, conducted   | 2.47 dB                   |
| Unwanted Emissions, conducted       | 2.50 dB                   |
| All emissions, radiated             | 4.88 dB                   |
| Time                                | 3.39%                     |

Uncertainty figures are valid to a confidence level of 95%.

UL LLC

## 5. EQUIPMENT UNDER TEST

## 5.1. EUT DESCRIPTION

The EUT is a wireless headset with BT/BLE radio.

## 5.2. MAXIMUM OUTPUT POWER

The transmitter has a maximum peak conducted output power as follows:

| Frequency Range | Frequency Range Mode |       | Output Power |
|-----------------|----------------------|-------|--------------|
| (MHz)           |                      | (dBm) | (mW)         |
| 2402 - 2480     | Basic GFSK           | 5.59  | 3.62         |
| 2402 - 2480     | Enhanced DQPSK       | 7.04  | 5.06         |
| 2402 - 2480     | Enhanced 8PSK        | 7.67  | 5.85         |

Note: GFSK, DQPSK, 8PSK average Power are all investigated, The GFSK & 8PSK Power are the worst case. Testing is based on these modes to showing compliance. For average power data please refer to section 8.4.

## 5.3. DESCRIPTION OF AVAILABLE ANTENNAS

The highest gain antenna assembly has a peak gain of 4.8 dBi in the 2.4 GHz band.

## 5.4. SOFTWARE AND FIRMWARE

The firmware installed in the EUT during testing was 0.7.8-107+a36ecaa2f The EUT driver software installed in the host support equipment during testing was 100.0.0.0 The test utility software, BlueTest3, used during testing was 3.1.4

Page 8 of 64

## 5.5. WORST-CASE CONFIGURATION AND MODE

Radiated emissions below 1GHz, above 18GHz, were performed with the EUT set to transmit at the channel with highest output power and worst-case mode.

Band edge and radiated emissions between 1GHz and 18GHz were performed with the EUT set to transmit at the highest power on low, middle and high channels.

The fundamental of the EUT was investigated in three orthogonal orientations X,Y,Z, it was determined that Y orientation was worst-case orientation; therefore, all final radiated testing was performed with the EUT in Y orientation.

Worst-case as determined by power measurements:

GFSK mode: DH1 8PSK mode: 3DH1

Note - DH1 testing represents DH3 and DH5 for GFSK and 8DPSK. DQPSK is represented by 8DPSK.

Additionally, the radios do not transmit when the USB charging cable is connected. Therefore, line conducted emissions was not performed.

## 7. MEASUREMENT METHODS

On Time and Duty Cycle: ANSI C63.10-2013 Section 11.6

Emissions BW (20dB): ANSI C63.10-2013 Section 6.9.2

Occupied BW (99%): ANSI C63.10-2013 Section 6.9.3

Output Power: ANSI C63.10 Subclause 11.9.1.3 (PKPM1)

Carrier Frequency Separation: ANSI C63.10-2013 Section 7.8.2

Number of Hopping Frequencies: ANSI C63.10-2013 Section 7.8.3

Time of Occupancy (Dwell Time): ANSI C63.10-2013 Section 7.8.4

Out-of-band emissions in non-restricted bands: ANSI C63.10 Section 7.8.6, 7.8.8 & 6.10.4

Out-of-band emissions in restricted bands: ANSI C63.10:2013 Sections 6.3-6.6, 6.10.5

## 8. ANTENNA PORT TEST RESULTS

## 8.1. ON TIME AND DUTY CYCLE

#### **LIMITS**

UL LLC

None; for reporting purposes only.

#### PROCEDURE

ANSI C63.10, Section 11.6 : Zero-Span Spectrum Analyzer Method.

#### **ON TIME AND DUTY CYCLE RESULTS**

| Mode ON Time   |        | Period | <b>Duty Cycle</b> | Duty  | Duty Cycle               | 1/T         |
|----------------|--------|--------|-------------------|-------|--------------------------|-------------|
|                | В      |        | x                 | Cycle | <b>Correction Factor</b> | Minimum VBW |
|                | (msec) | (msec) | (linear)          | (%)   | (dB)                     | (kHz)       |
| Bluetooth GFSK | 0.3825 | 1.249  | 0.306             | 30.6% | 5.14                     | 2.614       |
| Bluetooth 8PSK | 0.3927 | 1.246  | 0.315             | 31.5% | 5.01                     | 2.546       |

## 8.2. 20 dB AND 99% BANDWIDTH

#### <u>LIMITS</u>

None; for reporting purposes only.

Test per ANSI C63.10 Sections 6.9.2 and 6.9.3 and RSS-Gen 6.6.

#### TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The RBW is set to 1%-5% of the 20 dB bandwidth and 99% Occupied Bandwidth. The VBW is set to  $\geq$  RBW. The sweep time is coupled.

#### **RESULTS**

Page 15 of 64

| High    | 2480      | 1.214          | 1.151         |

## 8.3. OUTPUT POWER

#### LIMITS

§15.247 (b) (1)

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

#### RSS-247 5.4 (b)

For frequency hopping systems operating in the band 2400-2483.5 MHz and employing at least 75 hopping channels, the maximum peak conducted output power shall not exceed 1 W; for all other frequency hopping systems in the band, the maximum peak conducted output power shall not exceed 0.125 W.

The maximum antenna gain is less than or equal to 6 dBi, therefore the limit is 30 dBm.

## 8.5. HOPPING FREQUENCY SEPARATION

#### **LIMITS**

FCC §15.247 (a) (1)

RSS-247 (5.1) (b)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

#### TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The RBW is set to 300 kHz (approx. 30% of the channel spacing) and the VBW is set to  $\geq$  RBW. The sweep time is coupled.

#### **RESULTS**

Page 20 of 64

## 8.5.1. BLUETOOTH BASIC DATA RATE GFSK MODULATION

| Ch. A | Ch. B | Ch. 1 to<br>Ch. 2<br>Sep. | Max. 20<br>dB BW | Margin |
|-------|-------|---------------------------|------------------|--------|
| (MHz) | (MHz) | (MHz)                     | (MHz)            | (MHz)  |
| 2441  | 2442  | 1.000                     | 0.917            | -0.083 |

Page 21 of 64

## 8.5.2. BLUETOOTH ENHANCED DATA RATE 8PSK MODULATION

| Ch. A | Ch. B | Ch. 1 to<br>Ch. 2<br>Sep. | Max. 20<br>dB BW | 2/3 Max.<br>20dB BW | Margin |
|-------|-------|---------------------------|------------------|---------------------|--------|
| (MHz) | (MHz) | (MHz)                     | (MHz)            | (MHz)               | (MHz)  |
| 2441  | 2442  | 1.000                     | 1.214            | 0.809               | -0.191 |

Note: Frequency separation is greater than 2/3 of the maximum 20dB BW. Which is allowed as the maximum output power is 7.67dBm, which is less than 21dBm (125mW).

## 8.6. NUMBER OF HOPPING CHANNELS

#### <u>LIMITS</u>

FCC §15.247 (a) (1) (iii)

RSS-247 (5.1) (d)

Frequency hopping systems in the 2400 – 2483.5 MHz band shall use at least 15 nonoverlapping channels.

#### TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The span is set to cover the entire authorized band, in either a single sweep or in multiple contiguous sweeps for visibility of the entire span. Then, smaller spans are set to more clearly identify the channels. The RBW is set to 30% of the channel spacing (approx. 300kHz). The analyzer is set to Max Hold.

#### **RESULTS**

Normal Mode: All Channels Observed

## 8.7. AVERAGE TIME OF OCCUPANCY

#### <u>LIMITS</u>

FCC §15.247 (a) (1) (iii)

RSS-247 (5.1) (d)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

#### TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The span is set to 0 Hz, centered on a single, selected hopping channel. The width of a single pulse is measured in a fast scan. The number of pulses is measured in a 3.16 second scan, to enable resolution of each occurrence.

The average time of occupancy in the specified 3.16 second period (79 channels \* 0.4 s) is equal to 10 \* (# of pulses in 3.16 s) \* pulse width.

For AFH mode, the average time of occupancy in the specified 8 second period (20 channels \* 0.4 seconds) is equal to 10 \* (# of pulses in 0.8 s) \* pulse width.

#### **RESULTS**

Page 32 of 64

## 8.8. CONDUCTED SPURIOUS EMISSIONS

#### <u>LIMITS</u>

FCC §15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

#### IC RSS-247 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section A8.4 (4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

#### TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The resolution bandwidth is set to 100 kHz. The video bandwidth is set to 300 kHz.

The spectrum from 30 MHz to 26 GHz is investigated with the transmitter set to the lowest, middle, and highest channels.

The bandedges at 2.4 and 2.4835 GHz are investigated with the transmitter set to the normal hopping mode.

#### TEST PROCEDURE

The EUT is placed on a non-conducting table 80 cm above the ground plane for measurement below 1GHz; 1.5 m above the ground plane for measurement above 1GHz. The antenna to EUT distance is 3 meters. The EUT is configured in accordance with ANSI C63.10. The EUT is set to transmit in a continuous mode.

For measurements below 1 GHz the resolution bandwidth is set to 120 kHz for peak and/or quasi-peak detection measurements in the 30-1000MHz range, 9kHz for peak and/or quasi-peak detection measurements in the 0.15-30MHz range, and 200Hz for peak and/or quasi-peak detection measurements in the 9 to 150kHz range. Peak detection is used unless otherwise noted as quasi-peak.

For pre-scans above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 30 KHz for peak measurements.

For final measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz for peak measurements. For average measurements above 1GHz, the resolution bandwidth and video bandwidth are set as described in ANSI C63.10:2013 for the applicable measurement. The particular averaging method used for this test program was V1TR, where VBW =1/ $T_{on}$  and  $T_{on}$  is the on time.

The spectrum from 1 GHz to 18 GHz is investigated with the transmitter set to the lowest, middle, and highest channels in each applicable band. Below 1GHz and above 18GHz emissions, the channel with the highest output power was tested.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

#### KDB 414788 OATS and Chamber Correlation Justification

Based on FCC 15.31 (f) (2): measurements may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurements in the near field. OATs and chamber correlation testing had been performed and chamber measured test result is the worst case test result.

#### **RADIATED EMISSIONS**

\* - indicates frequency in CFR47 Pt 15 / IC RSS-Restricted Band \*\* - indicates frequency in Taiwan NCC LP0002 Restricted Band

PK-U: Maximum Peak

V1TR - VB=1/Ton, RMS Average where: Ton is packet duration

## 9.2. WORST-CASE BELOW 30MHz

#### SPURIOUS EMISSIONS BELOW 30 MHz (WORST-CASE CONFIGURATION)

Note: All measurements were made at a test distance of 3 m. The measured data was extrapolated from the test distance (3m) to the specification distance (300 m from 9-490 kHz and 30 m from 490 kHz – 30 MHz) to clearly show the relative levels of fundamental and spurious emissions and demonstrate compliance with the requirement that the level of any spurious emissions be below the level of the intentionally transmitted signal. The extrapolation factor for the limits were 40\*Log (test distance / specification distance).
