1 Introduction

SAR Test Report

At the request of Bose Corporation the BT Earbuds were evaluated for SAR in accordance with the requirements for FCC Part 2.1093 and RSS-102 Issue 5, and IEC/IEEE 62209-1528. Testing was performed in accordance with IEEE Std 1528:2013, IEC62209-2:2010, IEC/IEEE 1528, and the Office of Engineering and Technology KDB 447498. Testing was performed at the Intertek facility in Lexington, Kentucky. The FCC test site designation number was US1112. The SAR lab ISED company number was 2042M, CAB identifier US0127. The SAR lab A2LA certification number was 1926.01.

For the evaluation, the dosimetric assessment system DASY52 was used. The total uncertainty for the evaluation of the spatial peak SAR values averaged over a cube of 1g tissue mass had been assessed for this system to be $\pm 22.2\%$ from 300MHz – 3GHz and 24.6% from 3GHz – 6GHz.

The BT Earbuds were tested at the maximum output power measured by Intertek. Maximum output power measurements are tabulated under Section 8 Test Results. The maximum spatial peak SAR value for the sample device averaged over 1g is shown below.

Based on the worst-case data presented below, the BT Earbuds were found to be **compliant** with the 1.6 W/kg requirements for general population / uncontrolled exposure.

Table 1: Worst Case Reported SAR per Exposure Condition – FCC, ISED

| Tubi | rable 1: Worst case reported 3AR per Exposure condition Tee, 13EB | | | | | | | | | |
|-----------------------|---|------------------------|---------|------------------------------|-------------------------------|----------------------------|--|--|--|--|

Evaluation For: Bose Corporation

Product: BT Earbuds

Date: 8/25/2023

2 Test Site Description

The SAR test site located at 731 Enterprise Drive, Lexington KY 40510 is comprised of the SPEAG model DASY 5.2 automated near-field scanning system, which is a package, optimized for dosimetric evaluation of mobile radios [3]. This system is installed in an ambient-free shielded chamber. The ambient temperature is controlled to 22.0 $\pm 2^{\circ}$ C. During the SAR evaluations, the RF ambient conditions are monitored continuously for signals that might interfere with the test results. The tissue simulating liquid is also stored in this area in order to keep it at the same constant ambient temperature as the room.

2.2 Measurement Uncertainty

The Tables below includes the uncertainty budget suggested by the IEEE Std 1528-2013, IEC62209-2: 2010, and IEC/IEEE 62209-1528 as determined by SPEAG for the DASY5 measurement System.

4 System Verification

SAR Test Report

4.1 System Validation

Prior to the assessment, the system was verified to be within ±10% of the specifications by using the system validation kit. The system validation procedure tests the system against reference SAR values and the performance of probe, readout electronics and software. The test setup utilizes a phantom and reference dipole.

5 Evaluation Procedures

Prior to any testing, the appropriate fluid was used to fill the phantom to a depth of 15 cm \pm 0.2cm. The fluid parameters were verified and the dipole validation was performed as described in the previous sections.

Figure 3: Fluid Depth 15cm

Date: 8/25/2023

5.1 Test Positions:

SAR Test Report

The Device was positioned against the SAM phantom using the exact procedure described in IEEE Std 1528:2013, IEC62209-2:2010, IEC/IEEE 62209-1528, and the Office of Engineering and Technology KDB 447498.

5.2 Reference Power Measurement:

The measurement probe was positioned at a fixed location above the reference point. A power measurement was made with the probe above this reference position so it could used for the assessing the power drift later in the test procedure.

5.3 Area Scan:

A coarse area scan was performed in order to find the approximate location of the peak SAR value. This scan was performed with the measurement probe at a constant height in the simulating fluid. A two dimensional spline interpolation algorithm was then used to determine the peaks and gradients within the scanned area. The area scan resolution conformed to the requirements of KDB 865664 as shown in Table 7.

5.4 Zoom Scan:

A zoom scan was performed around the approximate location of the peak SAR as determined from the area scan. On the basis of this data set, the spatial peak SAR value was evaluated with the following procedure. The zoom scan resolution conformed to the requirements of KDB 865664 as shown in Table 7.

Table 7: SAR Area and Zoom Scan Resolutions

Date: 8/25/2023

5.5 Interpolation, Extrapolation and Detection of Maxima:

The probe is calibrated at the center of the dipole sensors which is located 1 to 2.7 mm away from the probe tip. During measurements, the probe stops shortly above the phantom surface, depending on the probe and the surface detecting system. Both distances are included as parameters in the probe configuration file. The software always knows exactly how far away the measured point is from the surface. As the probe cannot directly measure at the surface, the values between the deepest measured point and the surface must be extrapolated.

In DASY5, the choice of the coordinate system defining the location of the measurement points has no influence on the uncertainty of the interpolation, Maxima Search and extrapolation routines. The interpolation, extrapolation and maximum search routines are all based on the modified Quadratic Shepard's method.

Thereby, the interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation. The DASY5 routines construct a once-continuously differentiable function that interpolates the measurement values as follows:

- For each measurement point a trivariate (3-D) / bivariate (2-D) quadratic is computed. It interpolates the measurement values at the data point and forms a least-square fit to neighboring measurement values.
- The spatial location of the quadratic with respect to the measurement values is attenuated by an inverse distance weighting. This is performed since the calculated quadratic will fit measurement values at nearby points more accurate than at points located further away.
- After the quadratics are calculated for at all measurement points, the interpolating function is calculated as a weighted average of the quadratics.

There are two control parameters that govern the behavior of the interpolation method. One specifies the number of measurement points to be used in computing the least-square fits for the local quadratics. These measurement points are the ones nearest the input point for which the quadratic is being computed. The second parameter specifies the number of measurement points that will be used in calculating the weights for the quadratics to produce the final function. The input data points used there are the ones nearest the point at which the interpolation is desired. Appropriate defaults are chosen for each of the control parameters.

The trivariate quadratics that have been previously computed for the 3-D interpolation and whose input data are at the closest distance from the phantom surface, are used in order to extrapolate the fields to the surface of the phantom.

In order to determine all the field maxima in 2-D (Area Scan) and 3-D (Zoom Scan), the measurement grid is refined by a default factor of 10 and the interpolation function is used to evaluate all field values between corresponding measurement points. Subsequently, a linear search is applied to find all the candidate maxima. In a last step, non-physical maxima are removed and only those maxima which are within 2 dB of the global maximum value are retained.

Date: 8/25/2023

5.6 Averaging and Determination of Spatial Peak SAR

The interpolated data is used to average the SAR over the 1g and 10g cubes by spatially discretizing the entire measured volume. The resolution of this spatial grid used to calculate the averaged SAR is 1mm or about 42875 interpolated points. The resulting volumes are defined as cubical volumes containing the appropriate tissue parameters that are centered at the location. The location is defined as the center of the incremental volume. The spatial-peak SAR must be evaluated in cubical volumes containing a mass that is within 5% of the required mass. The cubical volume centered at each location, as defined above, should be expanded in all directions until the desired value for the mass is reached, with no surface boundaries of the averaging volume extending beyond the outermost surface of the considered region. In addition, the cubical volume should not consist of more than 10% of air. If these conditions are not satisfied then the center of the averaging volume is moved to the next location. Otherwise, the exact size of the final sampling cube is found using an inverse polynomial approximation algorithm, leading to results with improved accuracy. If one boundary of the averaging volume reaches the boundary of the measured volume during its expansion, it will not be evaluated at all. Reference is kept of all locations used and those not used for averaging the SAR. All average SAR values are finally assigned to the centered location in each valid averaging volume.

All locations included in an averaging volume are marked to indicate that they have been used at least once. If a location has been marked as used, but has never been assigned to the center of a cube, the highest averaged SAR value of all other cubical volumes which have used this location for averaging is assigned to this location. Only those locations that are not part of any valid averaging volume should be marked as unused. For the case of an unused location, a new averaging volume must be constructed which will have the unused location centered at one surface of the cube. The remaining five surfaces are expanded evenly in all directions until the required mass is enclosed, regardless of the amount of included air. Of the six possible cubes with one surface centered on the unused location, the smallest cube is used, which still contains the required mass.

If the final cube containing the highest averaged SAR touches the surface of the measured volume, an appropriate warning is issued within the post processing engine.

5.7 Power Drift Measurement:

The probe was positioned at precisely the same reference point and the reference power measurement was repeated. The difference between the initial reference power and the final one is referred to as the power drift. This value should not exceed 5%. The power drift measurement was used to assess the output power stability of the test sample throughout the SAR scan.

5.8 RF Ambient Activity:

During the entire SAR evaluation, the RF ambient activity was monitored using a spectrum analyzer with an antenna connected to it. The spectrum analyzer was tuned to the frequency of measurement and with one trace set to max hold mode. In this way, it was possible to determine if at any point during the SAR measurement there was an interfering ambient signal. If an ambient signal was detected, then the SAR measurement was repeated.

Date: 8/25/2023

6 Criteria

SAR Test Report

The following ANSI/IEEE C95.1 – 1992 limits for SAR apply to portable devices operating in the General Population/Uncontrolled Exposure environment. Uncontrolled environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

| Exposure Type (General Population/Uncontrolled Exposure environment) | SAR Limit (W/kg or mW/g) |
|--|--------------------------|
| Average over the whole body | 0.08 |
| Spatial Peak (1g) | 1.60 |
| Spatial Peak for hands, wrists, feet and ankles (10g) | 4.00 |

The following ICNIRP limits for SAR apply to portable devices operating in the General Population/Uncontrolled Exposure environment.

| Exposure Type (General Population/Uncontrolled Exposure environment) | SAR Limit (W/kg or mW/g) |
|--|-----------------------------|
| Average over the whole body | 0.08 |
| Spatial Peak (10g) | 2.00 |
| Spatial Peak for hands, wrists, feet and ankles (10g) | 4.00 |

7 Test Configuration

The BT Earbuds were designed to be used against the head, in either the left or right ear. Therefore, each earbud was successively placed against the ear position of the respective SAM head phantom.

The device was evaluated according to the specific requirements found in the following KDBs and Standards:

- FCC KDB 447498 D04 v01, General RF Exposure Guidance
- FCC KDB 865664 D01 v01r04, SAR Measurement Requirements for 100MHz to 6GHz
- RSS-102 Issue 5, Radio Frequency (RF) Exposure Compliance of Radiocommunication Apparatus (All Frequency Bands)
- IEC/IEEE 62209-1528

8 Test Results

The worst case 1g SAR value for head exposure was less than the 1.6W/kg FCC and ISED limit. The worst case 10g SAR value for head exposure was less than the 2.0W/kg ICNIRP limit.

9 SAR Data:

The results on the following page(s) were obtained when the device was transmitting at maximum output power. The worst case plots, which reveal information about the location of the maximum SAR with respect to the device, are referenced are shown in APPENDIX B – Worst Case SAR Plot. The measured conducted output power was compared to the power declared by the manufacturer and used for scaling the measured SAR values.

Yellow = Highest observed 1-g SAR

Test Personnel: Brian Lackey Test Date: 08/18/2023 - 08/23/2023 Supervising/Reviewing Engineer: (Where Applicable) Tissue Depth: Test Commands 22.4C Signal Setup: Ambient Temperature: Power Method: Fully Charged Battery Relative Humidity: 48.6% Pretest Dipole Verification: Yes Atmospheric Pressure: 989.2mbar

Deviations, Additions, or Exclusions:

1) Per KDB 447468 D04v01 §3.2.1 Testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR for the mid-band or highest output power channel is SAR ≤ 0.8 W/kg for 1-g, or SAR ≤ 2.0 W/kg for 10-g, when the transmission band span is ≤ 100 MHz

Evaluation For: Bose Corporation

Product: BT Earbuds Date: 8/25/2023

10 APPENDIX A – System Validation Summary

Per FCC KDB 865664, a tabulated summary of the system validation status including the validation date(s), measurement frequencies, SAR probes and tissue dielectric parameters have been included in the summary table below. The validation was performed with reference dipoles using the required tissue equivalent media for system validation according to KDB 865664. Each probe calibration point was validated at a frequency within the valid frequency range of the probe calibration point. All measurements were performed using probes calibrated for CW signals. Modulations in the table above represent test configurations for which the SAR system has been validated. The SAR system was also validated with modulated signals per KDB 865664.

11 APPENDIX B – Worst Case SAR Plots

11.1 Right Earbud

SAR Test Report

Date/Time: 8/23/2023 1:36:39 PM

Test Laboratory: Intertek File Name: Right Earbud.da53:0

Right Earbud Procedure Notes:

DUT: Right Earbud; Serial: ACBF71402E0C

Communication System: UID 0, DH5, Power Level 7; Communication System Band: 2.4Ghz ISM; Frequency: 2441

MHz; Duty Cycle: 1:1

Medium parameters used: f = 2441 MHz; $\sigma = 1.827$ S/m; $\varepsilon_r = 38.284$; $\rho = 1000$ kg/m³

Phantom section: Right Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2007)

DASY5 Configuration:

- Probe: EX3DV3 SN3516; ConvF(8.62, 8.62, 8.62) @ 2441 MHz;
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn358; Calibrated: 11/10/2022
- Phantom: SAM 2 with CRP v5.0; Type: QD000P40CD; Serial: TP:1663
- DASY52 52.10.4(1535);

Configuration/Outside Face 3/Area Scan (41x51x1): Interpolated grid: dx=1.200 mm, dy=1.200 mm Maximum value of SAR (interpolated) = 0.715 W/kg

Configuration/Outside Face 3/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 18.62 V/m; Power Drift = 0.05 dB

Peak SAR (extrapolated) = 1.44 W/kg

SAR(1 g) = 0.549 W/kg; SAR(10 g) = 0.210 W/kg (SAR corrected for target medium)

Smallest distance from peaks to all points 3 dB below = 8.6 mm

Ratio of SAR at M2 to SAR at M1 = 43.4%

Maximum value of SAR (measured) = 0.637 W/kg

0 dB = 0.637 W/kg = -1.96 dBW/kg

Report Number: 105427744LEX-001

Date: 8/25/2023

11.2 Left Earbud

SAR Test Report

Date/Time: 8/23/2023 8:49:08 AM

Test Laboratory: Intertek File Name: Left Earbud.da53:0

Left EarbudProcedure Notes:

DUT: Left Earbud; Serial: ACBF714036BC

Communication System: UID 0, DH5, Power Level 7; Communication System Band: 2.4Ghz ISM; Frequency: 2441

MHz;Duty Cycle: 1:1

Medium parameters used: f = 2441 MHz; $\sigma = 1.827$ S/m; $\varepsilon_r = 38.284$; $\rho = 1000$ kg/m³

Phantom section: Left Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2007)

DASY5 Configuration:

- Probe: EX3DV3 SN3516; ConvF(8.62, 8.62, 8.62) @ 2441 MHz;
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn358; Calibrated: 11/10/2022
- Phantom: SAM 2 with CRP v5.0; Type: QD000P40CD; Serial: TP:1663
- DASY52 52.10.4(1535);

Configuration/Outside Face 3/Area Scan (41x51x1): Interpolated grid: dx=1.200 mm, dy=1.200 mm Maximum value of SAR (interpolated) = 0.540 W/kg

Configuration/Outside Face 3/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 17.10 V/m; Power Drift = 0.03 dB

Peak SAR (extrapolated) = 1.12 W/kg

SAR(1 g) = 0.447 W/kg; SAR(10 g) = 0.178 W/kg (SAR corrected for target medium)

Smallest distance from peaks to all points 3 dB below = 8.9 mm

Ratio of SAR at M2 to SAR at M1 = 44.4%

Maximum value of SAR (measured) = 0.530 W/kg

0 dB = 0.530 W/kg = -2.76 dBW/kg

Date: 8/25/2023

12 APPENDIX C – Dipole Validation Plots

Date/Time: 8/18/2023 11:05:34 AM

Test Laboratory: Intertek

File Name: 2023-08-18 D2450V2 SAM Twin 2450MHz HSL.da53:0

2023-08-18 D2450V2 SAM Twin 2450MHz HSL

Procedure Notes:

SAR Test Report

DUT: D2450V2 - SN718; Serial: SN718

Communication System: UID 0, CW (0); Communication System Band: D2450 (2450.0 MHz); Frequency: 2450

MHz; Duty Cycle: 1:1

Medium parameters used (interpolated): f = 2450 MHz; $\sigma = 1.781 \text{ S/m}$; $\epsilon_r = 38.341$; $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2007)

DASY5 Configuration:

- Probe: EX3DV3 SN3516; ConvF(8.62, 8.62, 8.62) @ 2450 MHz;
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn358; Calibrated: 11/10/2022
- Phantom: SAM 2 with CRP v5.0; Type: QD000P40CD; Serial: TP:1663
- DASY52 52.10.4(1535);

Configuration/Unnamed procedure/Area Scan (51x51x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (interpolated) = 6.50 W/kg

Configuration/Unnamed procedure/Volume Scan (7x7x7): Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 55.47 V/m; Power Drift = 0.10 dB

Peak SAR (extrapolated) = 10.5 W/kg

SAR(1 g) = 4.96 W/kg; SAR(10 g) = 2.28 W/kg (SAR corrected for target medium)

Total Absorbed Power = 0.0364 W

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 5.62 W/kg

0 dB = 5.62 W/kg = 7.50 dBW/kg

Report Number: 105427744LEX-001

Date: 8/25/2023
