EMC TEST REPORT

Test Type:	Emissions
Product Type:	*Wireless Earbud*
Product Name/Number:	*Model BL3R*
FCC ID: IC:	*A94BL3R* *3232A-BL3R*
Prepared For:	*Product Assurance Engineering Department, Bose Corporation*
Name of manufacturing agency applying for equipment type approval	Bose Corporation
Postal Address of manufacturing Agency	The Mountain Framingham MA 01701 USA
Test Results:	Pass
Applicable Standards:	*FCC 47 CFR PART 15 SUBPART B* *FCC 47 CFR PART 15 SUBPART C* *ISED RSS-247 ISSUE 2* *ISED RSS-GEN ISSUE 5*
Report Number:	*EMC.BL3R.2020.125.1*

General Comments/Special Test Conditions:
This report relates only to the items tested. This report covers EMC marking requirements for
Enter product and any special modifications or test conditions.

	Print Name	Signature	Date
Prepared By:	Chad Bell	Chad Bell	May 4, 2020
Electrical Engineer Review* By:	Bryan Cerqua	Bryan H Cerqua	May 6, 2020

* Since every test result is separately reviewed after its completion, the electrical engineer review indicated above represents a higher-level review to ensure this report lists and contains all applicable and appropriate requirements.
If the report carries the “accredited” logo, the reviewer must verify all the tests in this report are covered under the current ISO17025 accreditation. The A2LA-accredited logo must be removed if any of the tests in the report are not performed under the current scope of accreditation. It is the responsibility or the reviewer to ensure the A2LA advertising policy is followed.

Table of Contents

Tests Performed (Table of Contents):

Test Report Summary

Product Information:

Description

Wireless Earbud. The antenna is an inverted L with a maximum gain of 1.35dBi formed by Laser Direct Sequence on the inside of the top cover of the earbud.

EUT Condition

Product was as built in the factory. And for the conducted measurements the antenna was removed, and coaxial cable was installed in its place. Where necessary USB debug wires were added to allow control of the Radio. Worst case data rate was determined to be 1Mbps.

Setup (Cables and Accessories)

Support Equipment List				
Description	**Manufacturer**	**Model**	**Serial Number**	**FCC ID**
AC Adapter	Bose	S008VU0500160	068170Z50403725AE	N/A

I/O Cable List					
Cable No.	**Port**	**# of Identical Ports**	**Cable Type**	**Cable Length (m)**	**Remarks**
1	AC In	1	N/A	0	Wall-wart adapter
2	USB	1	Shielded	0.3	Output of AC adapter

Test Objective:

Verify product meets all applicable EMC requirements.

Results:

Product complies with all applicable EMC requirements. All final results represent worst-case emissions and/or immunity.

Conclusions:

The device under test (D.U.T.):
[**X**] meets all test standards on page 1 of this report.

Affirmation of Test Results:

	Print Name	Signature	Date
Testing Engineer/Technician	Chad Bell	Chad Bell	May 4, 2020

Test Results Summary

99% Occupied Bandwidth

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	February 13, 2020	
Requirements Standard(s):			**Referenced Standard(s):**		
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	Braun Room
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

Conclusion:

This test is for information only.

Limits:

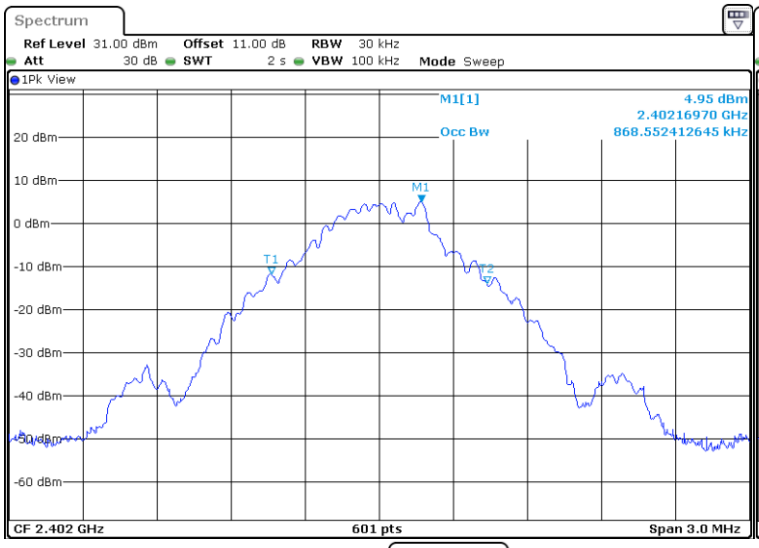
None; for reporting purposes only.

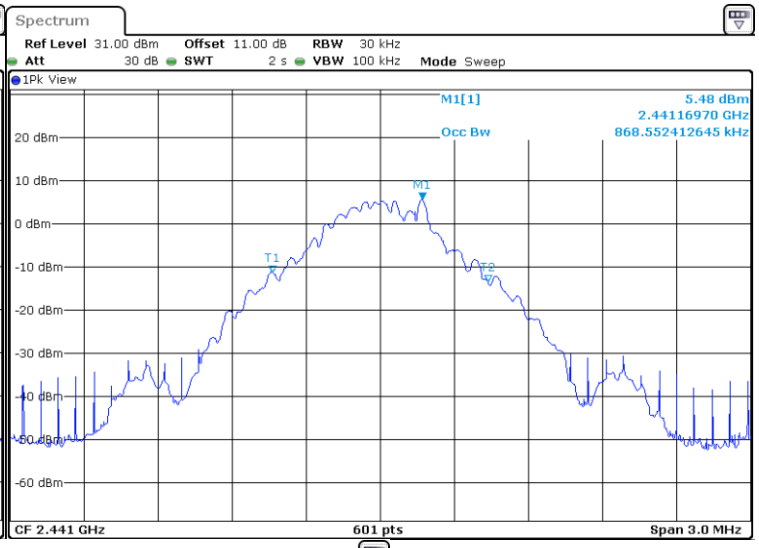
Procedure:

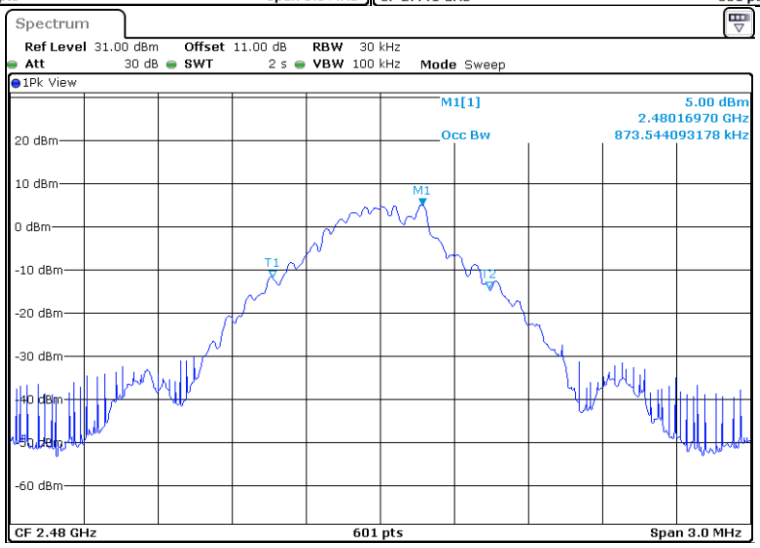
The transmitter output is connected to a spectrum analyzer. The RBW is set to ≥ 1-5% of the 99% Occupied Bandwidth. The VBW is set to ≥ RBW. The sweep time is coupled.

Basic Rate (DH5) Data Collection:

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	0.8686
Middle	2441	0.8686
High	2480	0.8735

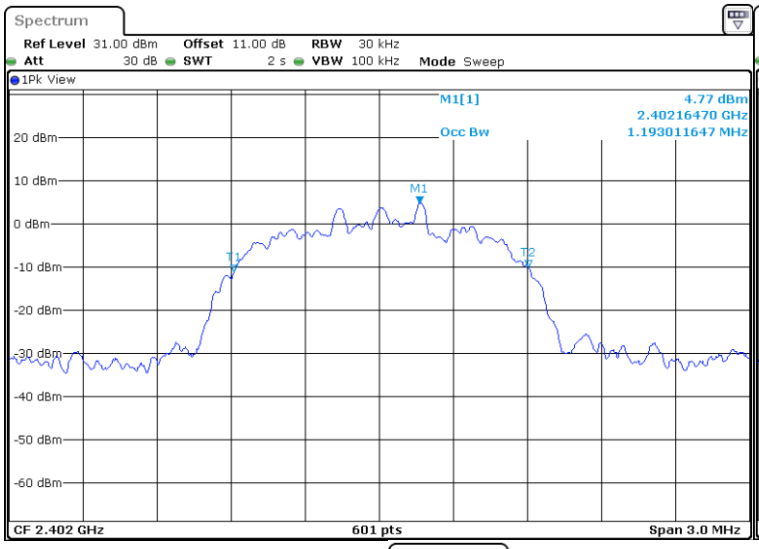


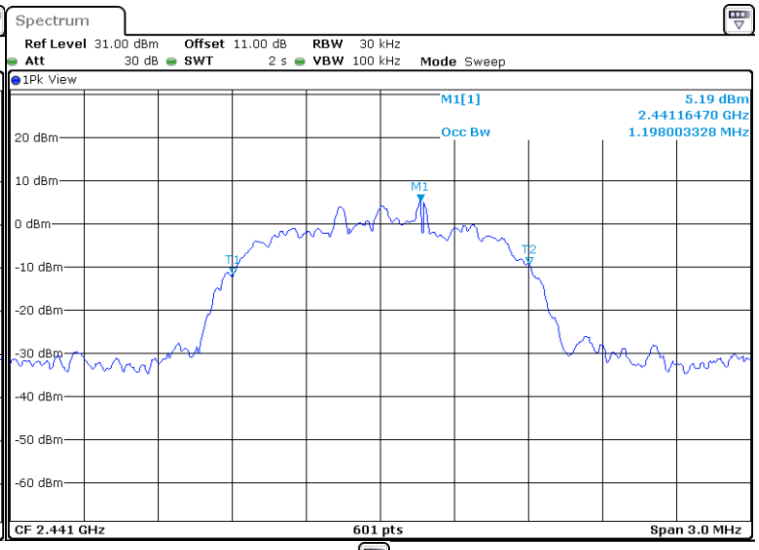


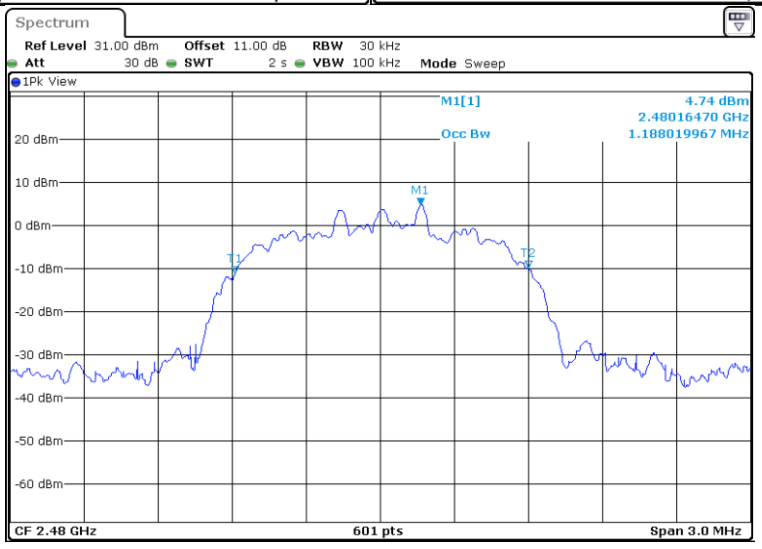


Enhanced Data Rate (3DH5) Data Collection:

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	1.193
Middle	2441	1.198
High	2480	1.188







Equipment Used:

TN	Description	Model	S/N	Manufacturer	Most Recent Calibration	Calibration Due Date	Most Recent Verification	Verification Due Date
2408	Signal and Spectrum Analyzer	FSV40	101414	Rohde & Schwarz	27-Mar-2019	26-Mar-2020		

Hopping Frequency Separation

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	February 13, 2020	
Requirements Standard(s):	FCC 15.247 (a) (1), IC RSS-247 5.1 (2)		**Referenced Standard(s):**		
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

Conclusion:

Hopping frequencies are separated by 1MHz which is more than the required minimum of 25kHz and more than 2/3 of the 20dB bandwidth of the hopping channel which would be 795kHz.

Limits:

FCC §15.247 (a) (1)

RSS-247 (5.1) (b)

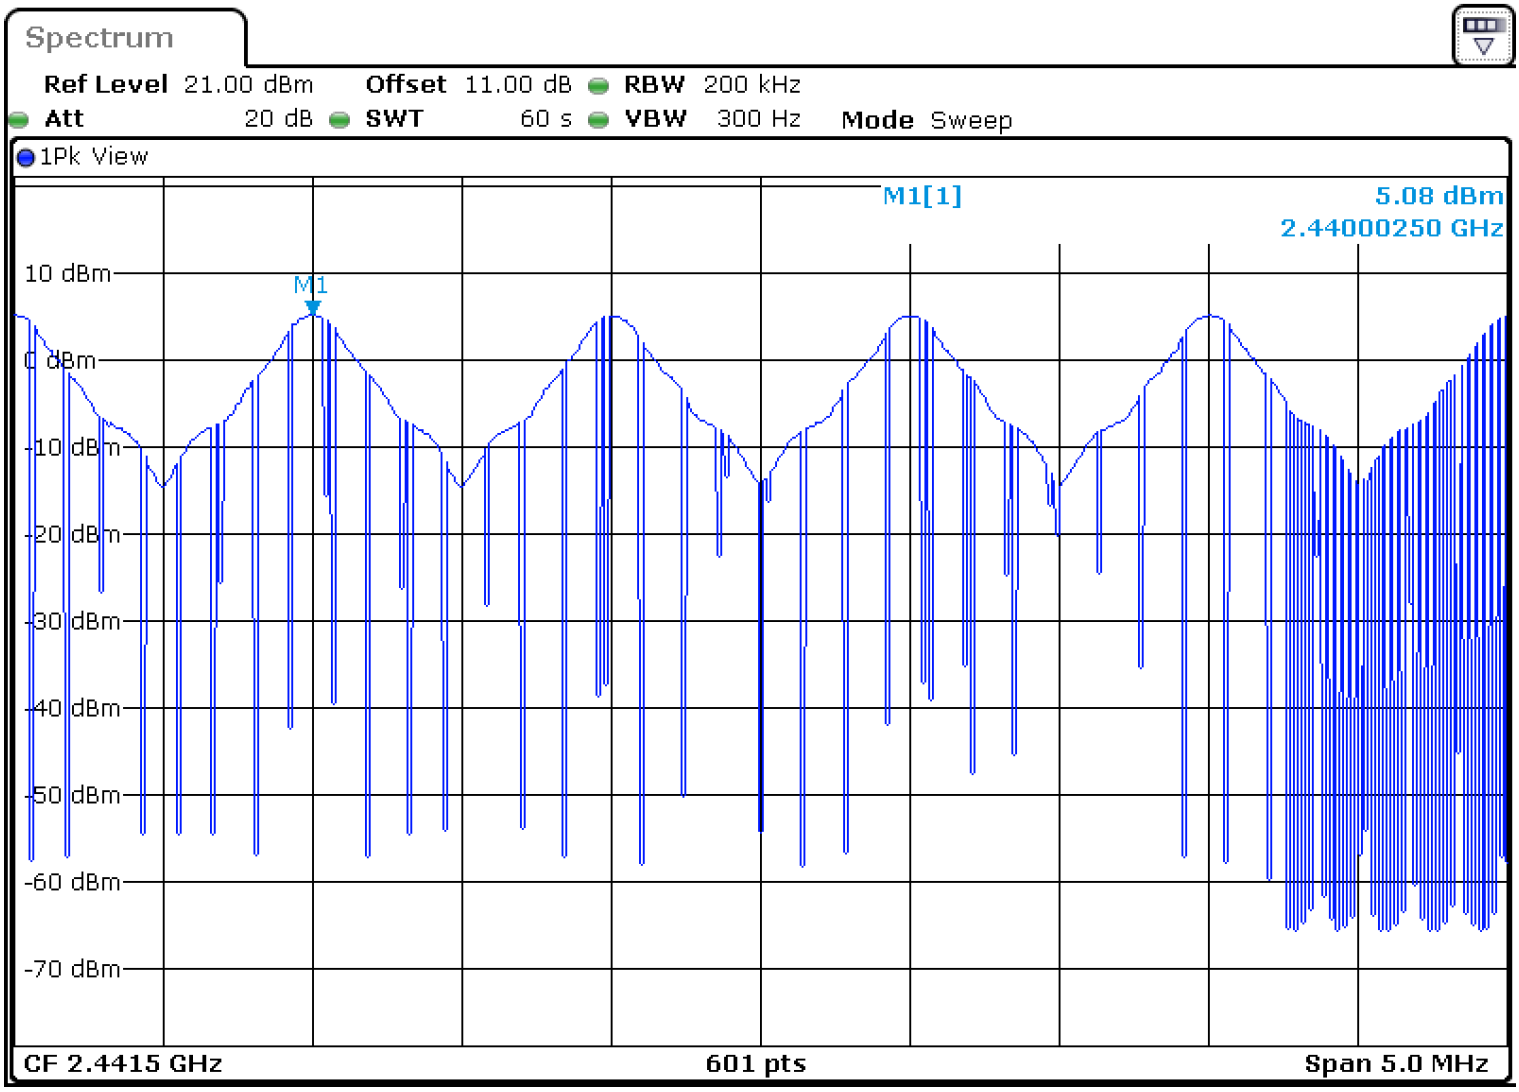
Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20dB bandwidth of the hoping channel, whichever is greater.

Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Procedure:

The transmitter output is connected to a spectrum analyzer. The RBW is set to 300 kHz (approx. 30% of the channel spacing) and the VBW is set to 300 kHz. The sweep time is coupled.

Data Collection:



Equipment Used:

TN	Description	Model	S/N	Manufacturer	Most Recent Calibration	Calibration Due Date	Most Recent Verification	Verification Due Date
2408	Signal and Spectrum Analyzer	FSV40	101414	Rohde & Schwarz	27-Mar-2019	26-Mar-2020		

Number of Hopping Channels

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	February 13, 2020	
Requirements Standard(s):	FCC 15.247 (a) (1) (iii) IC RSS-247 5.1 (4)		**Referenced Standard(s):**		
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

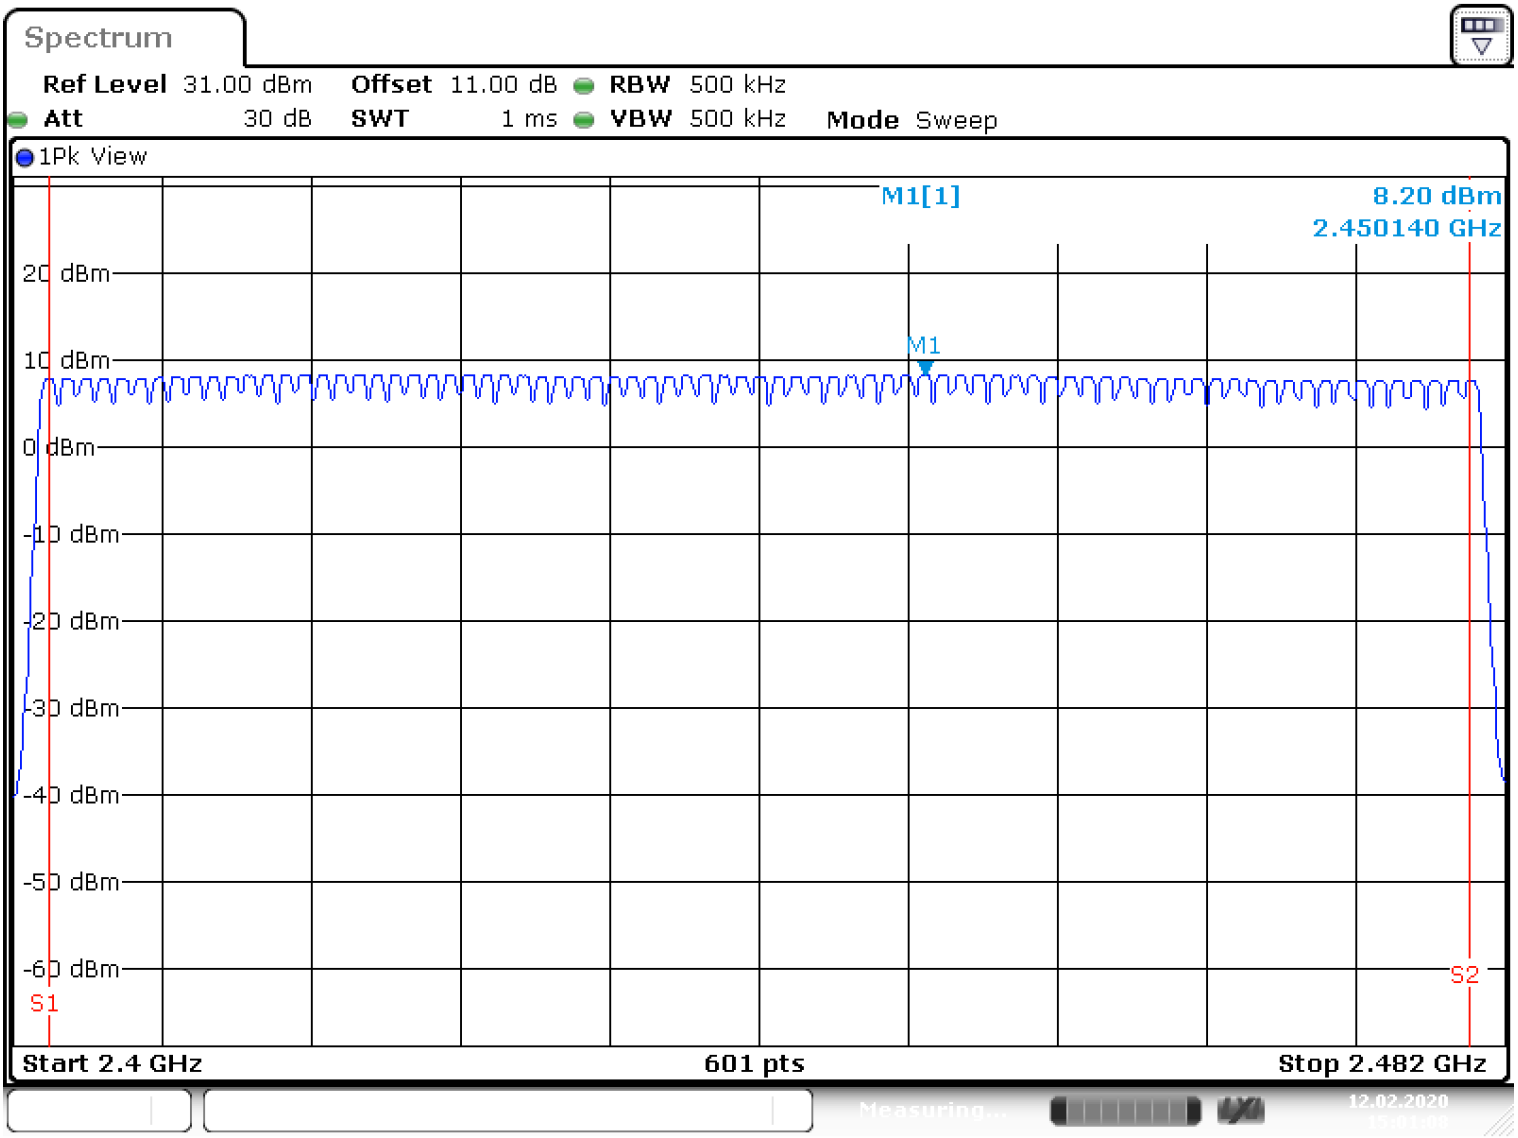
Conclusion:

Bose Model BL3R uses 79 hopping channels in normal operation and always uses at least 20, both of which are more than the required 15.

Limits:

FCC 15.247 (a) (1) (iii), IC RSS-247 5.1 (4)
Frequency hopping systems in the 2400 – 2483.5 MHz band shall use at least 15 non-overlapping channels.

Data Collection:



Plot1 79 Hopping Frequency DH5

Date: 12.FEB.2020 15:01:08

Limits:

FCC §15.247 (2)

RSS-247 5.2 (a)

ANSI 63.10:2013 - 6.9.2

The minimum 6 dB bandwidth shall be at least 500 kHz.

Equipment Used:

TN	Description	Model	S/N	Manufacturer	Most Recent Calibration	Calibration Due Date	Most Recent Verification	Verification Due Date
2408	Signal and Spectrum Analyzer	FSV40	101414	Rohde & Schwarz	27-Mar-2019	26-Mar-2020		

Average Time of Occupancy

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	February 13, 2020	
Requirements Standard(s):	FCC 15.247 (a) (1) (iii) IC RSS-247 5.1 (4)		**Referenced Standard(s):**		
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

Conclusion:

The highest time of occupancy in any mode is 318.5mS which passes the 400mS limit by 81.53mS.

Limit:

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Equipment Used:

TN	Description	Model	S/N	Manufacturer	Most Recent Calibration	Calibration Due Date	Most Recent Verification	Verification Due Date
2408	Spectrum Analyzer	FSV40	101414	Rohde & Schwarz	27-Mar-2019	26-Mar-2020		

Data Collection:

Channel	Frequency (MHz)	Mode	Pulse Width (mS)	Number of pulses in 3.16 S	Number of pulses in 31.6 S (X 10)	Time of occupancy (Pulse Width X Number of pulses) (mS)	Limit (mS)	Margin (mS)	Result

Output Power

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	February 13, 2020	
Requirements Standard(s):	FCC §15.247 (b) (3) RSS-247 5.4 (d)		**Referenced Standard(s):**		
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	Braun Room
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

Conclusion:

The Bose Model BL3R passes output power by 18.63dB.

Limits:

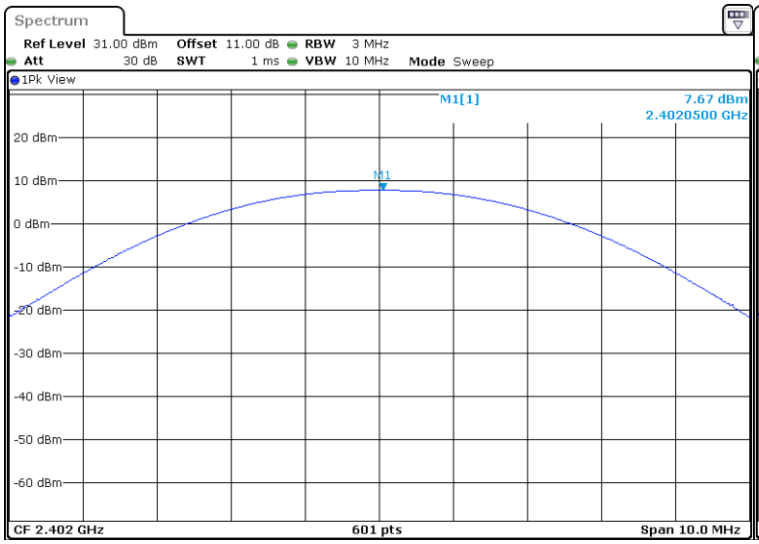
FCC §15.247 (b) (3)

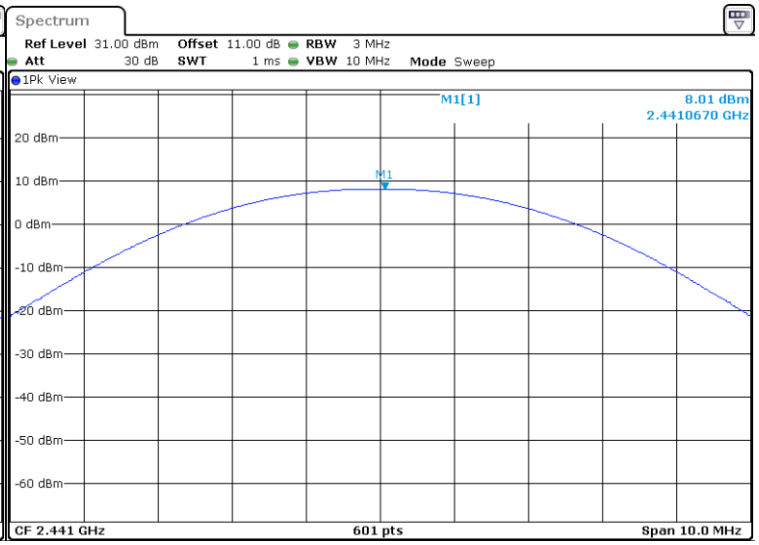
RSS-247 5.4 (d)

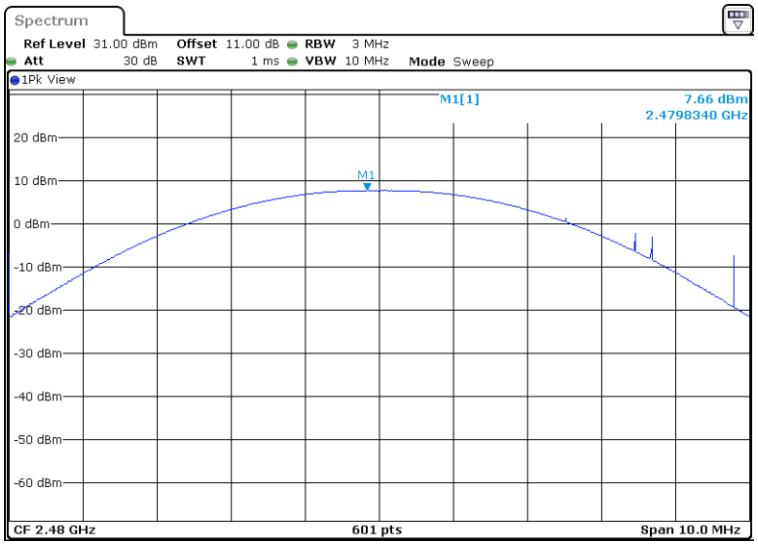
The maximum antenna gain is less than or equal to 6 dBi, therefore the limit is 30 dBm.

Basic Rate (DH5) Data Collection:

Output Power Summary Table						
Channel	Frequency (MHz)	Output Power (dBm)	Directional Gain (dBi)	Limit (dB)	Margin (dB)	Result
Low	2402	7.67	1.35	30	20.98	Pass
Middle	2440	8.01	1.35	30	20.64	Pass
High	2480	7.66	1.35	30	20.99	Pass

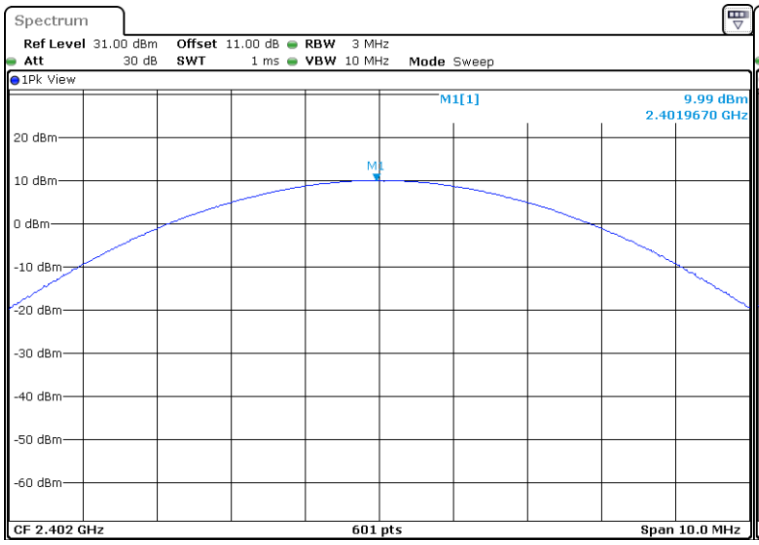


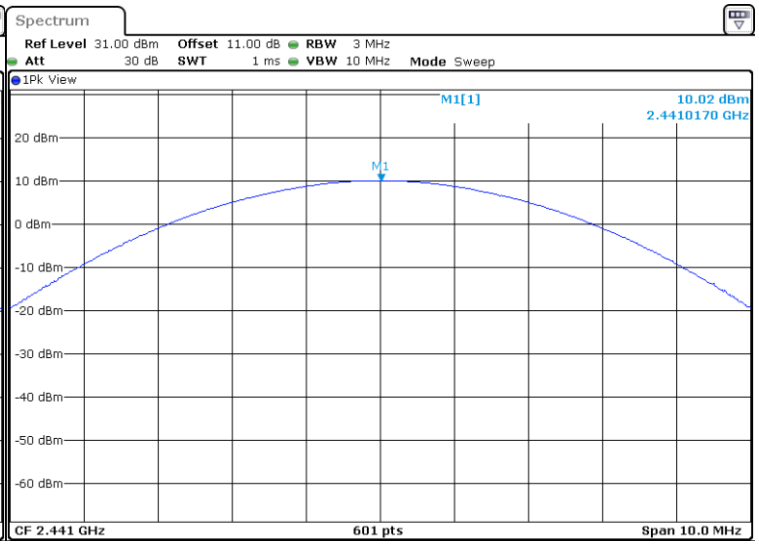


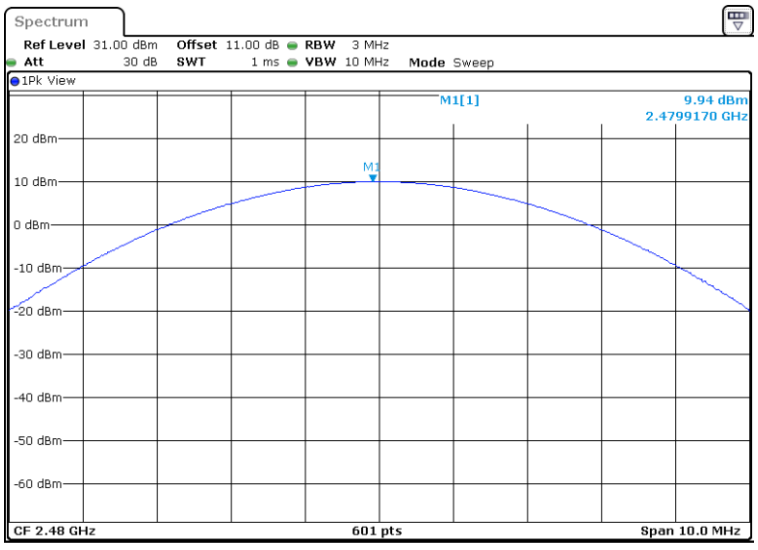


Enhanced Data Rate (3DH5) Data Collection:

Output Power Summary Table						
Channel	Frequency (MHz)	Output Power (dBm)	Directional Gain (dBi)	Limit (dB)	Margin (dB)	Result
Low	2402	9.99	1.35	30	18.66	Pass
Middle	2440	10.02	1.35	30	18.63	Pass
High	2480	9.94	1.35	30	18.71	Pass







Limits:

FCC §15.247 (b) (3)

RSS-247 5.4 (d)

The maximum antenna gain is less than or equal to 6 dBi, therefore the limit is 30 dBm.

Equipment Used:

TN	Description	Model	S/N	Manufacturer	Most Recent Calibration	Calibration Due Date	Most Recent Verification	Verification Due Date
2408	Signal and Spectrum Analyzer	FSV40	101414	Rohde & Schwarz	27-Mar-2019	26-Mar-2020		

Conducted Spurious Emissions

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	March 19, 2020	
Requirements Standard(s):	FCC §15.247 (d) RSS-247 5.5		**Referenced Standard(s):**	ANSI 63.10 (11.10.2)	
EUT powered with:	5V USB	**Temp / Humidity:**	n/a	**Test location:**	
Test equipment used TN's:	2408				
EUT Serial number(s):	Model BL3R conducted #1				
EUT Software installed:	0.3.8				
EUT Modification(s):	Product was tested as built except the antenna was disconnected and a coaxial cable was installed.				

Conclusion:

The Bose Model BL3R passes Conducted Spurious Emissions by more than 20dB.

Limits

FCC §15.247 (d)

RSS-247 5.5

Output power was measured based on the use of a peak measurement; therefore, the required attenuation is 20 dB.

Data Collection:

			QP	AVG	
FCC 15B/ CISPR32 based Class B only	A	0.15 - 0.5	79	66	-Ensure bandwidth set to 9 kHz. -EUT must pass both QP and AVG Limits. [1] These Limits decrease linearly with the log of the frequency. CISPR32 based standards: EN55032, AS/NZS CISPR32
		0.5 - 30	73	60	
	B	0.15 - 0.5	66-56[1]	56-46[1]	
		0.5 - 5	56	46	
		5 - 30	60	50	

Test Checklist:

No.	ITEM	(√ or n/a) →	OK
1	This checklist is intended to be a reminder of some highlights from the standards listed above, and not a step by step procedure. You must be familiar with the listed standards prior to using this checklist.		√
2	Check EUT performance prior to any testing.		√
3	Place the EUT on the table, with the rear of the unit aligned with the rear of the table. The EUT is to be 40 cm away from the screen room walls and ≥80 cm from all other metal objects (including other walls). Other system components should have a ~10 cm spacing and should be ≥80 cm from any metal objects.		√
4	Connect cables, accessories, and loads that would be utilized in a nominal configuration. Use judgment to determine minimum number of accessories required to achieve maximum level of emissions. If possible, avoid using peripheral components that would force multiple earth grounds. • For audio amplifier products that incorporate external speaker outputs, and are designed to connect to a variety of loudspeakers, it is recommended to terminate the speaker outputs with resistive loads equal to rated load impedance.		√
5	At least one of each type of EUT I/O port should have a customer intent cable connected to it. **Document cable configuration used for the test (describe cables used and take picture).**		√
6	Bundle EUT mains cord into 30-40 cm bundle. Do not bundle peripheral components' mains cords. I/O cables are draped over rear edge of tabletop, bundled if necessary, to keep them >40 cm above reference ground plane (floor).		√
7	RF filter/bead all non-system component cables (external source) where necessary.		√
8	Verify the proper mains voltage and frequency for the EUT.		√
AC MAINS PORT TESTING…			
9	The EUT line cord under test is connected to the EUT LISN. For multiple component systems with multiple line cords, each line cord shall be tested separately. All other system component line cords are connected to a second ("other system components") LISN. A power strip can be used for multiple components connected to the second LISN (but not for the EUT LISN). Unused LISN ports are terminated with 50 Ω terminators.		√
10	**If the EUT has I/O terminals which can be connected to an earth ground through peripheral equipment, the measurements shall be performed both with and without the EUT I/O ground/shell terminal connected to earth ground, with 150 ohms in series.** • Perform this test for each line cord which comprises the EUT (i.e. for a console/bass box type system, even when measuring the bass box line cord, the console is still considered part of the EUT, so measurements are performed with the console grounded, with 150 ohms in series, and ungrounded). • If the EUT has an unbalanced (coax) antenna input terminal as well as other I/O or mains terminals which connect to earth ground, measurements shall be performed with the antenna shell both ungrounded and grounded, with 150 ohms in series. When measuring with the antenna shell grounded with 150 ohms in series, no other earth grounds shall be connected per CISPR 32 (i.e. float safety grounds if necessary).		√
11	A transient limiter MUST be used to protect receiver input.		√
12	Ensure correct frequency, amplitude, bandwidth, and transducer factors are set on receiver.		√
13	**For average measurements, it is generally recommended to use receiver mode. If using spectrum analyzer mode for average measurements, be careful to provide sufficient sweep time to ensure accurate results.**		√
14	Perform measurements on both sides of mains (line and neutral).		√
15	EUT measured in all typical operational modes. Give special attention to modes where there is a potentially significant difference in spectral emissions. • Amplifiers are exercised up to maximum power (though not a requirement for CISPR 32). **• We deem it acceptable to use pink noise instead of 1 kHz sine wave as the input signal (allowed by CISPR 32).** • Connecting cable positions are varied to obtain worst case emissions, within the range of likely configurations. Cables are not positioned on top of, or under, the system components unless required by design. **• CISPR 32 specifies audio amps to be set to 1/8 power output during measurement, however if worst case emissions are found to be at another output level and are passing, it is sufficient to capture just the worst case emissions** (i.e. passing worst case results can be used for CISPR 32 as for FCC with a statement that emissions at other volume/output levels were less).		√
16	At each frequency where there is a significant emission, maximize each emission by changing the EUT cable orientation. Record the worst-case frequency, amplitude, mains conductor.		√

17	Document test results and test equipment using test template.	√
18	Take picture(s) of worst-case test set up.	√

Radiated Measurements

RF Radiated Emissions 30MHz -1GHz

Project code name:		**Marketing name:**		**Model number:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	Chad Bell		**Date:**	March 10, 2020	
Requirements Standard(s):	FCC Part15B		**Referenced Standard(s):**		
EUT powered with:	Bose Power P/T 722809-0010	**Temp / Humidity:**	N/A	**Test location:**	Maxwell House
Test equipment used TN's:	1375,2319,1541,3062,2077				
EUT Serial number(s):	C2.5 sample #2				
EUT Software installed:	Special software to enable 900mA charging in the charging case.				
EUT Modification(s):	None				

Conclusion:

Tested while playing audio and while charging, charging mode was found to be worst case and therefore what is represented in the report. The Bose Model BL3R passes Radiated Emissions from 30MHz-1GHz by 12.3dB.

Test Checklist:

No.	ITEM	(√ or n/a) →	OK
1	This checklist is intended to be a reminder of some highlights from the standards listed above, and not a step by step procedure. You must be familiar with the listed standards prior to using this checklist.		√
2	Check EUT performance, confirm proper mains voltage prior to testing.		√
3	If dimensions of EUT are greater than 1 meter in any direction, measurements performed at 3 meters may not be accurate, especially at lower frequencies.		√
4	Remove all non-essential items from the Maxwell House chamber.		√
5	Place comb generator field site source in reference location on turntable. Sweep source, verify results against established reference plot. Verification plot should be recorded in test setup verification section of this document.		√
6	Place EUT on turntable with the rear of the unit aligned with the table edge closest to the antenna (maintain ~10 cm spacing between components). Connect the cables, accessories, and loads that would be utilized in a nominal configuration (judgment can be used to determine the minimum number of accessories required to achieve the maximum level of emissions). Telescoping antennas should be fully extended and vertical. If this is an initial test of a system, decide what nominal configuration setup should be, bundle cables, and take a picture to ensure future tests are performed using same configuration. For formal reports record type and length of cables used.		√
7	At least one of each type of EUT I/O port shall have a customer intent cable connected to it. If more than one cable of any cable type measurably increases emissions, those cables shall be maintained in the test setup. Investigate all surfaces (top, bottom, sides, and front) for I/O ports not in the main cluster. Examples of ports that may not be in the main cluster of jacks are: • Headphone, HDMI, USB, jacks or other convenience jacks on the front of the EUT. Document cable configuration used for the test (describe cables used and take picture).		√
8	Whenever practical, all cables will be terminated in a representative load both with respect to impedance matching and paths to earth via power connections.		√
9	Dress mains cord according to standard (see below). Drape all other cables over the edge of the table at the rear of the EUT, and bundle the excess in the center to ensure ~40 cm above the ground plane (floor). Bundles should be ~30-40 cm in length.		√
10	Verify appropriate test antenna is being used. The central point of the EUT arrangement shall be positioned at the center of the turntable. The measurement distance is the shortest horizontal distance between an imaginary circular periphery just encompassing this arrangement and the calibration point of the antenna.		√
11	Ensure proper correction factors and limit lines are selected on receiver.		√
12	Ensure highest clock frequency used in EUT is known and taken into account to determine required frequency range. (Less than 108 MHz: 1 GHz, 108-500 MHz: 2 GHz, 500-1000 MHz: 5 GHz, greater than 1 GHz: 5 x fundamental up to 40 GHz for FCC and 6 GHz for CISPR22.) Above 1 GHz, average and peak Limits exist.		√
13	For average measurements, it is recommended to use receiver mode. If using spectrum analyzer mode for average measurements, be careful to provide sufficient sweep time to ensure accurate results.		√
14	For all measurements, it may be necessary to investigate individual emissions for periodic nature and insure adequate dwell time to obtain an accurate reading.		√
15	Since broadband emissions sources can at times look like the noise floor, when making measurements of these types of emission sources, be extra careful in making sure the signals to be measured have sufficient S/N ratio to provide valid measurements.		√
16	EUT is measured in all typical operational modes. Give special attention to modes where there is a potentially significant difference in spectral emissions. • Amplifiers are exercised up to maximum power. • Consider ports that may require active loads or signal sources to properly exercise the port and produce electrical traffic and emissions. • Ports may need to be activated (source selected) to “wake up” electrical signals and produce emissions.		√
17	Vary antenna height, antenna polarization, turn-table position, user controls, and connecting cable positions to obtain the worst case emissions, within the range of anticipated end user configurations. Cables are not positioned on top of, or under, the system components unless required by design.		√
18	Document the six worst case test result peaks using instrument software and or test template. Exclusions include peaks 20 dB or more below the limit and or system noise floor measurements.		√
19	Document all equipment used during the test. If tripod mounted antennas are used in the multi-GHz range, document the antenna positioning method and height scan range in the report.		√
20	Take picture(s) of worst case test set up.		√

Procedure:

Per 558074 D01 15.247 Meas Guidance v05r02:

Taking a RMS average measurement while the EUT is transmitting in operational duty cycle – The RMS average detector of a spectrum analyzer can be used for making average measurements with the EUT operating on its operational duty cycle. If the EUT supports more than one operational duty cycle the worst-case value should be used, i.e., the highest operational duty cycle. The measured RMS value using this method is compared against the limits and no other corrections are permitted.

The spectrum analyzer settings shall meet the requirements of ANSI C63.10 for making Average measurements. This measurement refers to spectrum analyzer settings in either 11.12.2.5.2 or 11.12.2.5.3 in ANSI C63.10; except when using 11.12.2.5.2, set Trace mode = Max Hold and the measurement correction factor in 11.12.2.5.2 i) is not added.

Radiated Band Edge

Project code name:		**Marketing name:**		**Model#:**	BL3R
Project number (Integrity):	BL3R	**Build Phase:**	C2.5		
Tested by:	N. Sanford		**Date:**	20Mar2020	
Requirements Standard(s):	CISPR32, FCC part 15B		**Referenced Standard(s):**		
EUT powered with:	Battery	**Temp / Humidity:**	N/A	**Test location:**	Marconi Manor
Test equipment used TN's:	1663,2373,2479,2357,2349,2385, 2929				
EUT Serial number(s):	Right Earbud: R3393				
EUT Software installed:	0.3.8				
EUT Modification(s):	USB Debug wires were attached to the earbud to allow control of the radio.				

Conclusion:

The Bose model BL3R passes Radiated Band Edge by 23.5dB.

Transmit Settings

CFG TX POWER = 10
Basic Rate = CFG PKT 15/339
EDR = CFG PKT 31/1020
TX DATA1 set frequency

Test Checklist:

No.	ITEM	(√ or n/a) →	OK
1	This checklist is intended to be a reminder of some highlights from the standards listed above, and not a step by step procedure. You must be familiar with the listed standards prior to using this checklist.		√
2	Check EUT performance, confirm proper mains voltage prior to testing.		√
3	Using the Test Setup Verification section on this document perform verification check. Note: Six ferite panels placed under the six middle cones, check 3-meter distance horn to front edge of turntable. Remove all non-essential items from the 3m chamber. Check bore-site (tilt) option set to on in the mast controller.		√
4	If EUT has an intentional radiator at 2.4GHz or 5GHz notch filters should be placed before the pre-amp to prevent its overload. Modify correction factor set in the receiver to include notch filter used.		√
5	Place EUT on turntable with the rear of the unit aligned with the table edge closest to the antenna (maintain ~10 cm spacing between components). Connect the cables, accessories, and loads that would be utilized in a nominal configuration (judgment can be used to determine the minimum number of accessories required to achieve the maximum level of emissions). Telescoping antennas should be fully extended and vertical. **If this is an initial test of a system, decide what nominal configuration setup should be, bundle cables, and take a picture to ensure future tests are performed using same configuration.** For formal reports record type and length of cables used.		√
6	At least one of each type of EUT I/O port shall have a customer intent cable connected to it. Investigate all surfaces (top, bottom, sides, and front) for I/O ports not in the main cluster. Examples of ports that may not be in the main cluster of jacks are headphone jacks or convenience jacks on the front of the EUT. **Document cable configuration used for the test (describe cables used and take picture(s)).**		√
7	Dress mains cord according to standard (see below). Drape all other cables over the edge of the table at the rear of the EUT, and bundle the excess in the center to ensure ~40 cm above the ground plane (floor). Bundles should be ~30-40 cm in length.		√
8	**Ensure highest clock frequency used in EUT is known and taken into account to determine required frequency range.** (Less than 108 MHz: 1 GHz, 108-500 MHz: 2 GHz, 500-1000 MHz: 5 GHz, greater than 1 GHz: 5 x fundamental up to 40 GHz for FCC and 6 GHz for CISPR22 and CISPR32.) For measurements above 1 GHz, both average and peak limits exist.		√
9	**For average measurements, it is generally recommended to use receiver mode. If using spectrum analyzer mode for average measurements, be careful to provide sufficient sweep time to ensure accurate results.**		√
10	EUT is measured in all typical operational modes. Give special attention to modes where there is a potentially significant difference in spectral emissions. Amplifiers are exercised up to maximum power. Vary, antenna polarization, turn-table position, user controls, and cable positions, to obtain the worst case emissions, within the range of likely configurations. Cables are not positioned on top of, or under, the system components unless required by design.		√
11	Document the six worst case test result peaks using instrument software and or test template. Exclusions include peaks 20 dB or more below the limit and or system noise floor measurements.		√
12	Document all equipment used during the test.		√
13	Take picture(s) of worst case test set up.		√

Data Collection:

FCC 15B Class B Product (Residential) @ 3 Meters
