1 Introduction

This test report is submitted in accordance with the FCC Rules and Regulations, Part 2, Subpart J, Sections 2.1046 through 2.1057 for equipment authorization of Northern Telecom's (Nortel Networks) CDMA 1900 MHz Multiple carrier Flexible Radio Module (MFRM).

The 1900 MHz MFRM is intended for use in the Domestic Public Cellular Radio Telecommunications Service and is designed in accordance with the following standards:

- *CFR 47, Part 24, Subpart E, Broadband Personal Communications Service [1]*
- *CFR 47, Part 2, Subpart J, Equipment Authorization Procedures - Equipment Authorization[2]*

1.1 Test Result Summary

Table 1 summarizes the measurement results[1] for the CDMA 1900 MHz MFRM.

Table 1 : Test Results Summary

FCC Measurement Specification	FCC Limit Specification	Description	Results
2.1046	24.232	RF Power Output	Compliant
2.1047		Modulation Characteristics	Not Applicable
2.1049		Occupied Bandwidth	OBW = 1.260 MHz
2.1051, 2.1057	24.238	Spurious Emissions at Antenna Terminals	Compliant
2.1055	24.235	Frequency Stability	Compliant

1. This report presents measurement results for tests performed by Nortel Networks. Field Strength of Spurious Emissions measurement results along with requirements specified in 2.1033 are covered in a separate test report from Sanmina Canada.

2 Engineering Declaration

The CDMA 1900MHz Multiple carrier Flexible Radio Module has been tested in accordance with the requirements contained in the Federal Communications Commission Rules and Regulations Part 2 and 24.

To the best of my knowledge, these tests were performed in accordance with good engineering practices using measurement procedures consistent with industry or commission standards or previous Commission correspondence or guidance and demonstrate that this equipment complies with the appropriate standards. All tests were conducted on a representative sample of the equipment for which equipment authorization is sought.

3 Equipment Authorization Application Requirements

3.1 Standard Test Conditions and Test Equipment

The MFRM was tested under the following standard test conditions unless otherwise noted:

- Ambient Temperature: 20 to 35 degrees C
- Ambient Humidity: 20 to 40%
- DC Supply Voltage: -48 Vdc (nominal)

3.2 EUT Identification List

Table 2 shows the identification of the components tested in this report.

Table 2 : EUT Identification List

Equipment Description	Model / Part Number	Release Number	Serial Number

4 Transmitter Test and Measurement Results

4.1 RF Power Output

4.1.1 RF Power Output Requirements

FCC Part 2.1046

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune -up procedure to give the values of current and voltage on the circuit elements specified in 2.983(d)(5). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

FCC Limit (Part 24.232)

The maximum RF power from a base station must not exceed 100 Watts.

4.1.2 Test Method

The DE was setup via the BTS controller to enable the MFRM to transmit at maximum power. Measurements were made in one, two, and three carrier configurations. The RF output power was measured using the power meter.

4.1.3 Test Setup

The set-up used for the MFRM RF output power test is illustrated in Figure 1. RF output power measurements were referenced to the antenna port of the DPM.

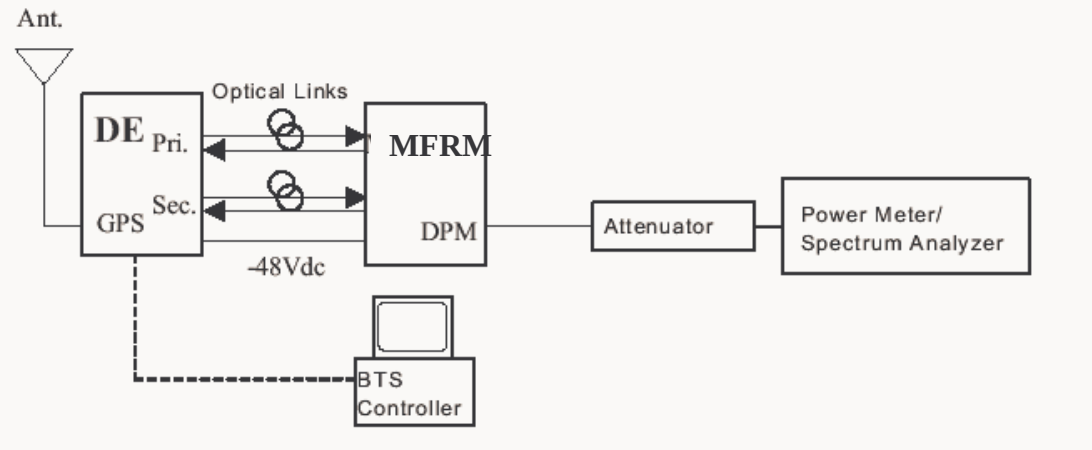

Figure 1 : Test Setup for RF Power Output Measurement

4.1.4 Test Results

The 1900 MHz MFRM complies with the requirement. The maximum measured RF output power from the MFRM was 46.0 dBm.

Table 4 : RF Output Power of 1900 MHz MFRM, 1 Carrier Mode

Channel Number (Band)	Frequency (MHz)	Measured RF Output Power (dBm)	Maximum Rated Power (dBm)	FCC Limit (dBm)
25 (A)	1931.25	45.90	46.0	50

4.2 Occupied Bandwidth

4.2.1 Occupied Bandwidth Requirements

FCC Part 2.1049

The OBW, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

(g) Transmitter in which the modulating baseband comprises not more than three independent channels - when modulated by the full complement of signals for which the transmitter is rated. The level of modulation for each channel should be set to that prescribed in rule parts applicable to the services for which the transmitter is intended. If specific modulation levels are not set forth in the rules, the tests should provide the manufacturer's maximum rated condition.

(h) Transmitters employing digital modulation techniques - when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment will be operated. The signal shall be applied through any filter networks, pseudo-random generators or other devices required in normal service. Additionally, the occupied bandwidth shall be shown for operation with any devices used for modifying the spectrum when such devices are optional at discretion of the user.

4.2.2 Test Method

The DE was setup via the BTS controller to enable the MFRM to transmit at maximum power. The occupied bandwidth was measured using the 99% channel power feature of the spectrum analyzer.

4.2.3 Test Setup

The set-up used for the MFRM Occupied bandwidth test is illustrated in Figure 2.

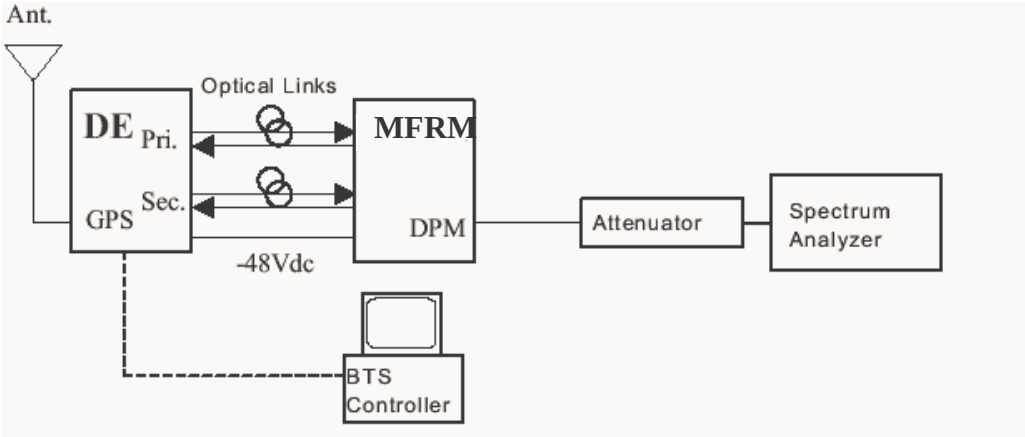

Figure 2 : Test Setup for Occupied Bandwidth Measurement

4.2.4 Test Results

The 1900 MHz MFRM complies with the requirement. The occupied bandwidth measured in one, two, and three carrier configurations for each licensed band is shown in Table 7. The plots that follow show the occupied bandwidth in one, two, and three carrier configurations. (Although plots were recorded for all channels tested, only one sample plot per carrier configuration is provided reduce the number of figures).

4.3 Spurious Emissions at Antenna Terminals

4.3.1 Spurious Emissions Requirements

FCC Part 2.1051

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

FCC Part 2.1057 - Frequency Spectrum to be investigated

The spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency or to the highest frequency practicable in the present state of the art of measuring techniques, whichever is lower. Particular attention should be paid to harmonics and subharmonics of the carrier frequency. Radiation at the frequencies of multiplier stages should be checked. The amplitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be reported.

FCC Part 24.238 Limit

(a) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmit power (P) by at least 43 + 10 log (P) dB.

(b) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

(c) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.

(d) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

4.3.2 Test Method

The BTS digital enclosure was configured via the BTS controller to enable the MFRM to transmit at maximum power. Measurements were made on channels at the bottom and top of the licensed sub-bands in one, two and three carrier configurations. The following spectrum analyzer settings were used for the measurement of the antenna port spurious emissions:

Adjacent 1MHz to indicated cellular band (Upper and Lower)

Resolution Bandwidth:	30 kHz (1 carrier, 2 carrier), 50kHz (3 carrier)
Video Bandwidth:	30 kHz (1 carrier, 2 carrier), 50kHz (3 carrier)
Video Average:	10 Averages
Span:	1 MHz
Attenuation:	0 dB
Ref. Level:	42.1 dBm
Ref. Level Offset:	50.7 dB

All spectrum analyzer settings were coupled as per the manufacturers recommendations to improve measurement time, without compromising data.

All other Spurious Emissions up to 20 GHz

Resolution Bandwidth:	1 MHz (1 carrier, 2 carrier, 3 carrier)
Video Bandwidth:	1 MHz (1 carrier, 2 carrier, 3 carrier)
Video Average:	10 Averages
Span:	Set accordingly
Attenuation:	0 dB
Ref. Level:	-10 dBm
Ref. Level Offset:	0 dB

The measured path loss of cables, connectors and attenuators are shown on Table 10. As the path loss varies over frequency from 10kHz to 10GHz, it is more accurate computing the spurious level by subtracting the attenuation and cables losses. Best approximation was used for losses between frequency.

Table 10 : Path loss of cables and attenuators from 10kHz to 10GHz

Frequency	Loss (dB)
10kHz	-49.3
50MHz	-49.5
800MHz	-50.3
1GHz	-50.5
2GHz	-50.7

3GHz	-51.5
4GHz	-52.2
5GHz	-51.9
6GHz	-52.2
7GHz	-52.3
8GHz	-51.9
9GHz	-53.2
10GHz	-53.1
11GHz	-53.1
11.5GHz	-53.6
12GHz	-53.3
12.5GHz	-53.0
13GHz	-53.4
14GHz	-53.6
15GHz	-53.7
16GHz	-55.7
16.3GHz	-58.0
16.5GHz	-55.7
17GHz	-55.2
17.5GHz	-55.7
18GHz	-57.0
19GHz	-57.2
19.5GHz	-59.5
20GHz	-60.9

4.3.3 Test Setup

The set-up used for the MFRM Antenna Port Spurious Emission test is illustrated in Figure 6.

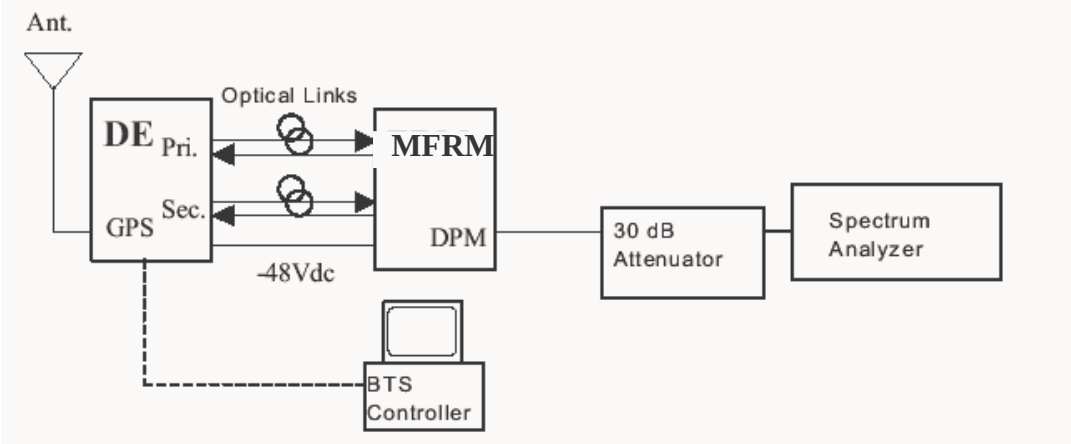

Figure 6 : Test Setup for Spurious Emissions Measurement

4.3.4 Test Results

The frequency spectrum from 10 kHz to 20 GHz was scanned for emissions using the spectrum analyzer settings outlined in the test method (Section 4.3.2). The MFRM complies with the limit of -13 dBm. Table 11 shows the spurious emissions at the antenna port of the MFRM for 1 , 2 and 3 carrier modes. The plots that follow show the spurious emissions in one, two, and three carrier configuration. (For each configuration, only some samples of one, two and three carriers are shown to reduce the number of figures).

Table 11 : Spurious Emissions at the 1900 MHz MFRM Antenna Port

Frequency (MHz)	Spurious Emissions Level (dBm)			Margin to FCC Limit of -13 dBm (dB)		
	1 carrier (30 kHz RBW)	2 carrier (30 kHz RBW)	3 carrier (30 kHz RBW)	1 carrier	2 carrier	3 carrier
1930.00 (lower edge of band A)	-23.4		-26.1	10.4		13.1
1944.95 (upper edge of band A)	-25.2		-21.0	12.2		8.0
1945.00 (lower edge of band D)	-28.8		-25.9	15.8		12.9
1949.95 (upper edge of band D)	-26.0		-27.4	13.0		14.4

Frequency (MHz)	Spurious Emissions Level (dBm)			Margin to FCC Limit of -13 dBm (dB)		
	1 carrier (30 kHz RBW)	2 carrier (30 kHz RBW)	3 carrier (30 kHz RBW)	1 carrier	2 carrier	3 carrier
1950.00 (lower edge of band B)	-26.1	-24.8	-26.6	13.1	11.8	13.6
1964.95 (upper edge of band B)	-25.8	-25.6	-26.9	12.8	12.6	13.9
1965.00 (lower edge of band E)	-25.1		-25.9	12.1		12.9

4.4 Frequency Stability

4.4.1 Frequency Stability Requirements

FCC Part 2.1055

(a) The frequency stability shall be measured with variation of ambient temperature as follows:

(1) From -30 to +50 centigrade for all equipment except that specified in subparagraphs (2) and (3) of this paragraph.

(b) Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10 centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement. The short term transient effects on the frequency of the transmitter due to keying (except for broadcast transmitters) and any heating element cycling normally occurring at each ambient temperature level also shall be shown. Only the portion or portions of the transmitter containing the frequency determining and stabilizing circuitry need be subjected to the temperature variation test.

(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.
(2) For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.
(3) The supply voltage shall be measured at the input to the cable normally provided with the equipment, or at the power supply terminals if cables are not normally provided. Effects on frequency of transmitter keying (except for broadcast transmitters) and any heating element cycling at the nominal supply voltage and at each extreme also shall be shown.

(e) When deemed necessary, the Commission may require tests of frequency stability under conditions in addition to those specifically set out in paragraphs (a), (b), (c) and (d) of this section. (For example, measurements showing the effect of proximity to large metal objects, or of various types of antennas, may be required for portable equipment.)

FCC Part 24.235 Limit

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

4.4.2 Results

The DE incorporates a GPS module from Trimble Navigation. This 10MHz GPS reference is used to synchronize the entire Base Station. The GPS module has a frequency stability of 0.8 ppb over the range of -5C to 70C. The Base Station complied with the requirement.
