Tim,

I have several comments on the grant just received:

(2) On the grant, the frequency range for B band should be "881.13 - 888.87" not "881.13 - 888.9".

[ATCB] Note that the frequency band specifying 888.9 is only applicable to the F9W which is from the original grant. I had noticed this originally and looked at the original application summary. Note that the summary for the original application showed 888.9. Any further comments regarding this?

[Thomas Wong] The original filing we were tested was one channel closer to the band edge than the system specification; therefore, in this filing we were testing according to the system specification. If there is easy to change from 888.9 to 888.87MHz, please do so. I don't think the extra 30KHz will cause our system to fail the FCC; however, I would prefer the frequency range is the same as our system specification.
