## 1. INTRODUCTION

### 1.1. OBJECT

This report presents the test data in accordance with FCC Part 24 Subpart E for the S12000 Indoor and Outdoor Base-stations in PCS1900 band configured with:

- HePA (GMSK 60W / Edge 45W) 1900,

HePA1900 has been tested with eDRX1900 association during the last certification (FCC ID AB6S12000).
New Software release allows the functionality of HePA1900 with old DRX version (DRX ND, DRX ND2) with GMSK functionality only (Permissive Change Class1).

- PA (GMSK 30W / Edge 30W ) 1900

These results can be applied for mixed BTS configuration 1900 Band PA (GMSK 30W / Edge 30W) and HePA (GMSK 60W / Edge 45W)

This report presents also the test data in accordance with FCC Part 22, Subpart H, for the S12000 Indoor and Outdoor Base-stations in 850 Band configured with:

- PA (GMSK 30W / Edge 30W) GSM850
- New module introduction: HePA (GMSK 60W / Edge 45W) GSM850.

These results can be applied for 1900 / 850 Dual Band BTS configurations with different mixed power amplifier type PA (GMSK 30W / Edge 30W) and HePA (GMSK 60W / Edge 45W).

This report presents test data for GMSK modulation and 8PSK modulation (EDGE functionality).

### 1.2. SCOPE

This document applies to the GSM850 / PCS1900 Outdoor and Indoor S12000 BTS versions.
This report introduces a new module introduction: HePA (GMSK 60W / Edge 45W) GSM850.
eDRX1900 and DRX ND 1900 radio module have equivalent radio performances and equivalent thermal behaviour. DRX ND have been tested during old FCC certification with PA1900 30W.

Radio performances with eDRX1900/HePA1900 can be applied to DRX ND, DRX ND2 associated with HePA1900. Only the GMSK functionality is ensured with DRX ND.

The last certification with eDRX1900 / HePA1900 ensures the FCC compliance of DRX ND/HePA1900 association.

### 1.3. PRODUCT CONFIGURATIONS

As the RF transmit paths are identical in both the Outdoor system and Indoor system, testing has been conducted on the Indoor or Outdoor version.

As we use same modules eDRX, HePA and duplexer in S8000/S12000 BTS, measurements available in this document can be applied to S12000 BTS and S8000 BTS.

Measurements were taken with all available coupling configurations including with duplexer involve the compliance with H2D (two input coupler with 3dB loss coupling associated with duplexer) and the H4D configuration (four input coupler with 7 dB loss coupling associated with duplexer).

The systems use both GMSK modulation and 8PSK, testing was done with both modulation types.

Clock frequency on the Radio Board 13 MHz created from 4.096 MHz coming from the Digital board.

## 4. EXHIBIT 1 : TEST REPORT - HEPA PCS1900

### 4.1. INTRODUCTION

The following information is submitted for update of the type acceptance of a Broadband PCS Base Station for Northern Telecom, Inc., in accordance with FCC Part 24, Subpart E and Part 2, Subpart J of the FCC Rules and Regulations.
The measurement procedures were in accordance with the requirements of Part 2.

### 4.2. MEASUREMENT RESULTS

Table 1 is a summary of the measurement results for this update.
Table 1 : Measurement Results Summary

| FCC Measurement <br> Specification | IC <br> Limit <br> Specification | Description | Result | Note |
| :---: | :---: | :---: | :---: | :---: |
| $2.1046(a)$, <br> $2.1033(c)(8)$ <br> 24.232 | 6.2 | RF Power Output | Complies |  |
| 2.1049 |  | Occupied Bandwidth | Complies |  |
| $2.1051,2.1057$ <br> 24.238 | 6.3 | Spurious Emissions at <br> Antenna Terminals | Complies | With power <br> reduction at band <br> edge channels |
| 2.1055 | 7.0 | Frequency Stability | Complies |  |
| 24.235 | 6.4 |  |  |  |

### 4.3. NAME OF TEST: RF POWER OUTPUT

### 4.3.1. FCC REQUIREMENTS - FCC PART 24.232

Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. See 24.53 for HAAT calculation method. Base station antenna heights may exceed 300 meters with a corresponding reduction in power. In no case may the peak output power of a base station transmitter exceed 100 watts.

### 4.3.2. TEST RESULTS

Table 2 shows the test results of RF Output Power for GMSK modulation with several coupling configurations:

| Radio Channel | $\begin{gathered} \hline \text { Frequency } \\ \text { (MHz) } \end{gathered}$ | $\begin{gathered} \text { Duplexer } \\ \text { Power (dBm) } \end{gathered}$ | $\begin{gathered} \hline \text { H2D } \\ \text { Power (dBm) } \end{gathered}$ | H4D <br> Power <br> (dBm) | HePA Output Power $(\mathrm{dBm})$ <br> (dBm) | Limit <br> (dBm) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 512 | 1930,2 | 45.8 | 42.2 | 39.3 | GMSK$(60 \mathrm{~W})$47.8 dBm$+/-0.5 \mathrm{~dB}$ | 50 dBm |
| 548 | 1937,4 | 46.1 | 42.4 | 39.6 |  |  |
| 585 | 1944,8 | 46.3 | 42.6 | 39.8 |  |  |
| 587 | 1945,2 | 46.3 | 42.6 | 39.8 |  |  |
| 598 | 1947,4 | 46.2 | 42.6 | 39.8 |  |  |

### 4.3.3. TEST PROCEDURE

The equipment was configured as shown in schematic 1.

## Schematic 1: Test configuration for RF Output Power

The BTS was configured to transmit at maximum power (static level 0) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

Measurements were made at frequencies which are the bottom, middle and top of each of the licensed blocks.

The output power was measured using the power meter which has the following settings :

Mode :
Reference Level Offset :

Average
Corrected to account for cable(s) and attenuator losses

### 4.4. NAME OF TEST : OCCUPIED BANDWIDTH

### 4.4.1. FCC REQUIREMENTS

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

### 4.4.2. TEST RESULTS

The maximum occupied bandwidth was found to be:
320.6 kHz , measured on channel 661, $\mathrm{f}=1960 \mathrm{MHz}$ in GMSK modulation, 317 kHz , measured on channel 661, $\mathrm{f}=1960 \mathrm{MHz}$ in 8PSK modulation.

Figure 1: Sample plot for occupied bandwidth in GMSK modulation

Figure 2: Sample plot for occupied bandwidth in 8PSK modulation

### 4.4.3. TEST PROCEDURE

The equipment was configured as shown in schematic 2 .
Schematic 2 : Test configuration for Occupied bandwidth

The BTS was configured to transmit at maximum power (static level 0 ) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

The occupied bandwidth was measured by determining the bandwidth out of which all emissions are attenuated at least 26 dB below the transmitter power.

The spectrum analyzer had the following settings :

Detector :
Trace:
Resolution bandwidth :
Video bandwidth :
Span :
Reference Level Offset :

Level range :
Sweep time :

Sample
Average
10 kHz
30 kHz
1 MHz
Corrected to account for cable(s) and attenuator losses
100 dB
25 ms

### 4.5. NAME OF TEST: SPURIOUS EMISSIONS AT ANTENNA TERMINALS

### 4.5.1. FCC REQUIREMENTS LIMITS - FCC PART 24.238

(a) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power $(\mathrm{P})$ by at least $43+10 \log (\mathrm{P}) \mathrm{dB}$.
(b) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
(c) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.
(d) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

### 4.5.2. TEST RESULTS WITH DUPLEXER CONFIGURATION

The reference level for spurious emissions at the antenna terminals is taken from the measured output power ( $46.3 \mathrm{dBm}=42.63$ Watts).

Therefore the spurious emissions must be attenuated by at least $43+10 * \log (42.63)=59.3 \mathrm{~dB}$ The measured output power was 46.3 dBm ; therefore the limit is $46.3-59.3=-13 \mathrm{dBm}$.

Spurious measurement is performed with the worst configuration with Duplexer coupling and 60 W High Power amplifier .

The Nominal power at antenna connector : PD $\max =46.5 \mathrm{dBm}$.
The test compliance with duplexer involves the compliance with H2D (two input coupler with 3 dB loss coupling associated with duplexer) and the compliance with H4D configuration (four input coupler with 7 dB loss coupling associated with duplexer).

Tables 5 and 6 show the results for Spurious Emissions at Antenna Terminals.

Table 5 : Spurious emissions with the diplexer for GMSK modulation

|  | Channel | Power <br> emission <br> level | Spurious <br> emissions <br> level (dBm) | Limit (dB) | Margin (dB) |

### 4.5.5. CONCLUSION

## - GMSK modulation:

| Coupling <br> Configuration | Antenna <br> Output <br> power (dBm) | Power reduction <br> Measurement <br> (qualification modules) | System Power limitation <br> GMSK modulation |
| :---: | :---: | :---: | :---: |
| Diplexer | 46.5 | Pmax $-4 \mathrm{~dB}=42.5 \mathrm{dBm}$ | Pmax - 6 dB $=\mathbf{4 0 . 5} \mathbf{~ d B m}$ |
| H2D | 43 | Pmax $=43 \mathrm{dBm}$ | Pmax - 2 dB $=\mathbf{4 1} \mathbf{~ d B m}$ |
| H4D | 40 | Pmax $=40 \mathrm{dBm}$ | Pmax $\quad=\mathbf{4 0} \mathbf{d B m}$ |

For system limit, 2 dB power reduction margin is taken to ensure the compliance for the case of diplexer and H2D due to eDRX/HePA products tolerances.

Performances measured with eDRX/HePA can be applied to DRX ND/HePA association (with GMSK modulation only).

In order to comply with the emission limits in the 1 MHz bands immediately outside and adjacent to the frequency block, the absolute transmit power level of the block edge channels has been done at $\mathbf{P m a x}-\mathbf{6 d B}=\mathbf{4 0 . 5} \mathbf{~ d B m}$ for the worst case in diplexer configuration.

- 8PSK modulation:
eDRX and HePA 1900 support 8 PSK modulation.

| Coupling | Antenna port <br> Output power <br> $(\mathbf{d B m})$ | Power reduction <br> measurement | System Power limitation <br> 8 PSK modulation |  |
| :---: | :---: | :---: | :--- | :--- |
| Diplexer | 45.8 | Pmax $-2 \mathrm{~dB}=43.8 \mathrm{dBm}$ | Pmax $-\mathbf{2} \mathbf{~ d B}=\mathbf{4 3 . 8} \mathbf{~ d B m}$ |  |
| H2D | 42 | Pmax $=42 \mathrm{dBm}$ | Pmax | $=\mathbf{4 2} \mathbf{~ d B m}$ |
| H4D | 39 | Pmax $=39 \mathrm{dBm}$ | Pmax | $=\mathbf{3 9} \mathbf{d B m}$ |

In the worst configuration (Diplexer), the maximum power emission with 2 dB reduced ( Pmax-2dB) allows to be compliant with the spurious emission limits ( -13 dBm ) in the 1 MHz bands immediately outside and adjacent to the frequency block for 8PSK modulation .

### 4.5.6. TEST PROCEDURE

The equipment was configured as shown in schematic 3 .

Schematic 3 : Test configuration for Spurious emissions at antenna terminals

For adjacent channels emissions, the BTS nominal carrier frequency was adjusted to each block edge channel.

Channels 512 and 810 are those channels which are at the lower and upper edges of the PCS band respectively.

The BTS was configured to transmit at maximum power (static level 0 ) or a reduced power :

- for GMSK modulation, in mode GMSK no synchro
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5 .

For these measurements, the resolution bandwidth of the spectrum analyzer was set to at least $1 \%$ of the emission bandwidth. In this case the emission bandwidth measured was closed to 300 kHz . Therefore, the resolution bandwidth was set to 3 kHz .

The spectrum analyzer had the following settings for adjacent band:

| Resolution bandwidth : | 3 kHz |
| :--- | :--- |
| Video bandwidth : | 10 kHz |
| Span : | 1 MHz |
| Reference Level Offset : |  |
|  | Corrected to account for cable(s), |
| Level range : | filter and attenuator losses |
| Sweep time : | 100 dB |
| Detector : | Coupled |
| Trace : | Sample |
| Sweep count : | Average |
|  | 200 |

For all other measurements the BTS carrier frequency was adjusted to Channel 810.
The spectrum analyzer had the following settings for out of block emissions.
Resolution bandwidth :
1 MHz
Video bandwidth :
1 MHz

The emissions were investigated up to the tenth harmonic of the fundamental emission (20 GHz ).

The measured level of the emissions was recorded and compared to the -13 dBm limit.

### 4.6. NAME OF TEST: FREQUENCY STABILITY

Table 6 shows the Frequency Stability for channel 661 ( $\mathrm{F}=1960 \mathrm{MHz}$ ) in BTS 12000 OUTDOOR configuration ( 8 HePA ) under extreme conditions.

Performances measured with eDRX/HePA can be applied to DRX ND/HePA association.

Table 11: Frequency Stability in BTS S12000 Outdoor configuration - Channel 661

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Maximum Carrier Frequency <br> Deviation (Hz) |  |  |
| :---: | :---: | :---: | :---: |
|  | $85 \%$ Nominal <br> Supply voltage <br> 195 V AC | Nominal Supply <br> voltage <br> 230 V AC | $115 \%$ Nominal <br> Supply voltage <br> 264 V AC |
|  | 50.3 | 56.8 | 47.4 |
| -20 | 56.9 | 56.5 | 45.4 |
| -10 | 57.7 | 56.6 | 43.7 |
| 0 | 62.3 | 49.2 | 61.5 |
| 10 | 49.7 | 54.6 | 48.0 |
| 20 | 49.2 | 58.7 | 56.3 |
| 30 | 56.5 | 49.4 | 53.9 |
| 40 | 58.7 | 71.0 | 63.0 |
| 50 | 60.7 | 61.0 | 56.6 |

The maximum frequency deviation allowed is 90 Hz .
The maximum deviation measured $(71 \mathrm{~Hz})$ is sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Outdoor BTS complies with the requirement.
Thermal tests have been performed with OUTDOOR BTS S12000.
The BTS S12000 must operate under the following external extreme temperatures:

$$
\text { - BTS S12000 Outdoor: } \quad-30^{\circ} \mathrm{C} /+50^{\circ} \mathrm{C}
$$

Frequency stability test is performed under following extreme conditions:

- Temperature from $-30^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ at intervals of 10 degrees.
- With AC power supply variations: 195 VAC , 230 VAC, 264 VAC.

All Modules (eDRX and HePA ) run with nominal power regulation at maximum power (60W) in GMSK modulation. The eDRX/HePA were configured to transmit at maximum power (Static level 0).

BTS S12000 is equipped with eDRX/HePA in slots $0,1,2,3,6,7,8,9$ with following emission configuration :

$$
\begin{array}{ll}
\text { slot } 0: \mathrm{BCCH} \rightarrow & \text { C542 } \\
\text { slot } 1: \mathrm{TCH} \rightarrow & \mathrm{C} 661 \\
\text { slot } 2: \mathrm{BCCH} \rightarrow & \mathrm{C} 572 \\
\text { slot 3: BCCH } \rightarrow & \text { C602 } \\
\text { slot } 6: \mathrm{BCCH} \rightarrow & \mathrm{C} 632 \\
\text { slot 7: BCCH } \rightarrow & \mathrm{C} 692 \\
\text { slot } 8: \mathrm{BCCH} \rightarrow & \mathrm{C} 722 \\
\text { slot } 9: \mathrm{BCCH} \rightarrow & \mathrm{C} 752
\end{array}
$$

Frequency deviation is measured in slot 1 on channel C661.

A period of at least one hour was allowed prior to measurement to ensure that all the components of the oscillator circuit was stabilized at each temperature.

The equipment was configured as shown in figure 16.

Figure 16: Test configuration for Frequency Stability

## 5. EXHIBIT 2: TEST REPORT FOR PA30W PCS1900/GSM850

### 5.1. INTRODUCTION

The following information is submitted to introduce a Certification of a Broadband PCS Base Station for Northern Telecom, Inc:

- According to FCC Part 24, Subpart E and Part 2,
- According to FCC Part 22, Subpart H and Part 2,

Subpart J of the FCC Rules and Regulations. The measurement procedures were in accordance with the requirements of Part 2.999.

### 5.2. MEASUREMENT RESULTS

Tables 1, 2 are a summary of the measurement results performed in this report.
Table 1: PCS 1900 Measurement Results Summary

| FCC Measurement Specification | $\begin{gathered} \text { IC } \\ \text { Limit } \\ \text { Specification } \end{gathered}$ | Description | Results | Note |
| :---: | :---: | :---: | :---: | :---: |

| 2.1055 | $8.1,8.2$ | Frequency Stability |  |  |

Measurements in GSMK modulation for GSM 850 Band are available in document [R7].
Additional GMSK tests are performed for the Edge channel of sub-band A", A, B, A', B'. Additional Tests are also performed in 8PSK modulation.

### 5.3. TEST NAME: 2.1046 RF OUTPUT POWER

## FCC REQUIREMENTS

## FCC Limit (Part 22.913) Effective radiated power limits

The effective radiated power (ERP) of base transmitters and cellular repeaters must not exceed 500 Watts.

## FCC Limit (Part 24.232) Power and antenna hight limits

Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. Base station antenna heights may exceed 300 meters with a corresponding reduction in power. In no case may the peak output power of a base station transmitter exceed 100 watts.

## TEST RESULTS GSM 850

### 5.4. TEST NAME: 2.1049 OCCUPIED BANDWIDTH

## FCC REQUIREMENTS

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated of at least 26 dB .

## TEST RESULTS GSM 850

Figure 1: sample plot for occupied bandwidth, @ M (GSM 850 band)

## GMSK modulation

## 8PSK Modulation

The maximum occupied bandwidth was found 320 kHz for GMSK modulation
The maximum occupied bandwidth was found 314 kHz for 8PSK modulation

## TEST RESULTS PCS 1900

Figure 2: sample plot for occupied bandwidth @ M (PCS 1900 band)

GMSK modulation

8PSK Modulation

The maximum occupied bandwidth was found to be:
320 kHz , measured on channel 661, $\mathrm{f}=1960.0 \mathrm{MHz}$ GMSK modulation. 318 kHz , measured on channel 661, $\mathrm{f}=1960.0 \mathrm{MHz}$ 8PSK modulation.

## TEST PROCEDURE

The equipment was configured as shown in Schematic1.

The BTS was configured to transmit at maximum power (Static Level 0). Measurements were performed at middle frequency of the transmit band.

The occupied bandwidth was measured by determining the bandwidth out of which all emissions are attenuated of at least 26 dB .

The spectrum analyzer had the following settings:

| Resolution bandwidth: | 10 kHz |
| :--- | :--- |
| Video bandwidth: | 30 kHz |
| Span: | 1 MHz and 2.2 MHz |
| Sweep time: | 25 ms |

### 5.5. TEST NAME: 2.1051 SPURIOUS EMISSIONS AT ANTENNA TERMINALS

## FCC REQUIREMENTS

(c) At any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least $43+10 \log (\mathrm{P}) \mathrm{dB}$.
(d) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
(e) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.
(f) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

## TEST RESULTS GSM 850

The reference level for spurious emissions at the antenna terminals is taken from the measured output power ( $43.9 \mathrm{dBm}=24.5$ Watts).
Therefore the spurious emissions must be attenuated by at least $43+10 * \log (24.5)=56.9 \mathrm{~dB}$. The measured output power was 43.9 dBm ; therefore the limit is $43.9-56.9=-13 \mathrm{dBm}$.

Spurious measurement is performed in the following coupling configuration with 30W Power amplifier and with duplexer .

The nominal power at antenna connector : Pduplexer max $=44 \mathrm{dBm}$

Tables 5 and 6 show the results for Spurious Emissions at Antenna Terminals.

Table 5: Test results for Spurious Emissions in GMSK modulation

## Conclusion :

For both modulation GMSK and 8PSK, the worst case is the Duplexer configuration and it has been done at PD max $-2 \mathrm{~dB}=42 \mathrm{dBm}$.

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 2 dB in order to meet spurious emission requirement.

For Edge Channel ARFCN 238, 241, the maximum power (44dBm) has allowed to meet spurious emission requirement.

The H2D configuration has been done at maximum power $\operatorname{PH2Dmax}=44 \mathrm{dBm}$.

## TEST RESULTS PCS 1900

Spurious measurement is performed with the worst configuration with Duplexer coupling and 30W Power amplifier . The Nominal power at antenna connector : PD max = 44dBm. The test compliance with duplexer involves the compliance with H2D (two input coupler with 3 dB loss coupling associated with duplexer) and the compliance with H4D configuration (four input coupler with 7 dB loss coupling associated with duplexer).

Table 8: Test results for Spurious Emissions at Antenna Terminals

## Conclusion :

- GMSK modulation:

The worst case is the Duplexer configuration and emission power has been done at PD max $-4 \mathrm{~dB}=40 \mathrm{dBm}$

In order to comply with the emission limits in the 1 MHz bands immediately outside and adjacent to the frequency block, the absolute transmit power level of the block edge channels is set to $\mathbf{4 0} \mathbf{~ d B m}$ for GMSK modulation.

- 8PSK modulation:
eDRX and eSCPA 1900 support 8 PSK modulation.
In the worst configuration (Diplexer), maximum emission power $\mathbf{P}=\mathbf{4 4} \mathbf{~ d B m}$ allows to be compliant with the spurious emission limits $(-13 \mathrm{dBm})$ in the 1 MHz bands immediately outside and adjacent to the frequency block for 8PSK modulation.

## TEST PROCEDURE

The equipment was configured as shown in schematic2.
Schematic2 : Test configuration for Spurious emissions at antenna terminals

For adjacent channels emissions, the BTS nominal carrier frequency was adjusted to each block edge channel.

The transmitter was set to operate to maximum power in Tx activation mode GMSK no synchro.

Initially the transmitter was set to operate to maximum power. Then in case of out of limits, the power has been decreased by 2 or 4 dB .

The BTS was configured to transmit at maximum power (static level 0 ) or a reduced power :

- for GMSK modulation, in mode GMSK no synchro
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5 .

For these measurements, the resolution bandwidth was of the spectrum analyzer was set to at least $1 \%$ of the emission bandwidth. In this case the emission bandwidth measured was near 300 kHz . Therefore, the resolution bandwidth was set to 3 kHz .

| The spectrum analyzer had the following settings for adjacent band: |  |
| :--- | :--- |
| Resolution bandwidth: | 3 kHz |
| Video bandwidth: | 10 kHz |
| Span: | 1 MHz |
| Reference Level Offset: | Corrected to take into account cables and <br> attenuator losses |
| Sweep time: | Coupled |
| Detector: | Sample |
| Trace: | Average |
| Sweep count: | 200 |

For all other measurements the BTS carrier frequency was adjusted to Channel 190 in GSM850 and Channel 810 in PCS 1900.

The spectrum analyzer had the following settings for out of block emissions.

$$
\begin{array}{ll}
\text { Resolution bandwidth: } & 1 \mathrm{MHz} \\
\text { Video bandwidth: } & 1 \mathrm{MHz}
\end{array}
$$

The emissions were investigated up to the twentieth harmonic of the fundamental emission $(20 \mathrm{GHz})$.

The measured level of the emissions was recorded and compared to the -13 dBm limit.

### 5.6. TEST NAME: 2.1055 FREQUENCY STABILITY

## FCC REQUIREMENTS

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

## TEST RESULTS GSM 850

Table 11 shows the Frequency Stability for channel $190(\mathrm{~F}=881.6 \mathrm{MHz})$ in BTS 12000 OUTDOOR configuration under extreme conditions.

Table 11: Frequency Stability in BTS S12000 Outdoor configuration - Channel 190

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Maximum Carrier Frequency <br> Deviation (Hz) |  |  |
| :---: | :---: | :---: | :---: |
|  | $85 \%$ Nominal <br> Supply voltage <br> 195 V AC | Nominal Supply <br> voltage <br> 230 V AC | $115 \%$ Nominal <br> Supply voltage <br> 264 V AC |

| 40 | 27.51 | 20.99 | 23.34 |
| 50 | 22.02 | -19.05 | 22.86 |

The maximum frequency deviation allowed is 90 Hz .
The maximum deviation measured $(-25.2 \mathrm{~Hz})$ is more than sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Outdoor BTS complies with the requirement.
Table 14 shows the Frequency Stability for channel 512 ( $\mathrm{F}=1930.2 \mathrm{MHz}$ ) in BTS 12000 Indoor configuration under extreme conditions.

Table 14: Frequency Stability in BTS S12000 Indoor configuration - Channel 512

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Maximum Carrier Frequency <br> Deviation (Hz) |  |  |
| :---: | :---: | :---: | :---: |
|  | Channel 512 @ DC supply voltage |  |  |
|  | -40 V | -48 V | -57 V |
| -5 | 13.2 | 11.2 | 17.7 |
| 5 | 22 | 22.6 | 21.4 |
| 15 | 12.6 | 16.2 | 15.2 |
| 25 | 15.3 | 12.7 | 15.1 |
| 35 | 13 | 12.6 | 13.9 |
| 45 | 13.9 | 15.6 | 16.5 |

The maximum frequency deviation allowed is 90 Hz .
The maximum deviation measured $(22,6 \mathrm{~Hz})$ is more than sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Indoor BTS complies with the requirement.

## TEST PROCEDURE

Thermal tests have been performed with S12000 BTS .
The BTS S12000 must operate under the following external extreme temperatures:

- BTS S12000 Outdoor :
$-30^{\circ} \mathrm{C} /+50^{\circ} \mathrm{C}$
- BTS S12000 Indoor:
$-5^{\circ} \mathrm{C} /+45^{\circ} \mathrm{C}$

Frequency stability test is performed under following extreme conditions:
for outdoor S12000 BTS

- Temperature from $-30^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ at intervals of 10 degrees.
- With AC power supply variations: 195 VAC , 230 VAC, 264 VAC
for Indoor S12000 BTS
- Temperature from $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ at intervals of 10 degrees.
- With DC power supply variations: $-40 \mathrm{~V},-48 \mathrm{~V},-57 \mathrm{~V}$.

The BTS S12000 must operate under the following external extreme temperatures:

Frequency stability test is performed under following extreme conditions:

Modules (eDRX and eSCPA ) run with nominal power regulation at maximum power (30W) in GMSK modulation. The eDRX/eSCPA were configured to transmit at maximum power (Static level 0).
A period of at least one hour was allowed prior to measurement to ensure that all the components of the oscillator circuit was stabilized at each temperature.

The equipment was configured as shown in Schematic3.
Schematic3: Test configuration for Frequency Stability

## 6. EXHIBIT 4: TEST REPORT - HEPA60W GSM850

### 6.1. INTRODUCTION

The following information is submitted for update of the type acceptance of a Broadband GSM Base Station for Nortel Networks, in accordance with FCC Part 22, Subpart H and Part 2, Subpart J of the FCC Rules and Regulations. The measurement procedures were in accordance with the requirements of Part 2.999.

### 6.2. MEASUREMENTS RESULTS

Table 1 is a summary of the measurement results for this update.

Table 1 : Measurement Results Summary

Measurements in GSMK modulation for GSM 850 Band are available in document [R7].
Additional GMSK tests are performed for the Edge channel of sub-band A", A, B, A', B'.
Additional Tests are also performed in 8PSK modulation.

### 6.3. NAME OF TEST: 2.1046 RF POWER OUTPUT <br> FCC REQUIREMENTS

### 4.3.1.1. FCC PART 22.913

(a) Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. See 24.53 for HAAT calculation method. Base station antenna heights may exceed 300 meters with a corresponding reduction in power. In no case may the peak output power of a base station transmitter exceed 500 watts.
(b) Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rmsequivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true peak measurement for the emission in question over the full bandwidth of the channel.

## TEST RESULTS

Table 2 shows the test results of BTS RF Output Power for GMSK modulation with several coupling configurations:

## TEST PROCEDURE

The equipment was configured as shown in schematic 1 .
Schematic 1: Test configuration for RF Output Power

The BTS was configured to transmit at maximum power (static level 0 ) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

Measurements were made at frequencies which are the bottom and top of each of the licensed blocks.

The output power was measured using the power meter which has the following settings :

$$
\begin{array}{ll}
\text { Mode : } & \text { Average } \\
\text { Reference Level Offset : } & \begin{array}{l}
\text { Corrected to account for cable(s) and attenuator } \\
\text { losses }
\end{array}
\end{array}
$$

### 6.4. NAME OF TEST: 2.1049 OCCUPIED BANDWIDTH FCC REQUIREMENTS

### 4.4.1.1. FCC PART 2.1049

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

## TEST RESULTS

Figure 1: sample plot for occupied bandwith

GMSK modulation

8PSK Modulation

The maximum occupied bandwidth was found 320 kHz for GMSK modulation
The maximum occupied bandwidth was found 314 kHz for 8PSK modulation

## TEST PROCEDURE

The equipment was configured as shown in schematic 2 .
Schematic 2: Test configuration for Occupied bandwidth

The BTS was configured to transmit at maximum power (Static Level 0). Measurements were made at frequencies which were at the bottom and top of the transmit band.

The occupied bandwidth was measured by determining the bandwidth out of which all emissions are attenuated at least 26 dB below the transmitter power.

The spectrum analyzer had the following settings :

| Resolution bandwidth : | 10 kHz |
| :--- | :--- |
| Video bandwidth : | 30 kHz |
| Span : | 1 MHz |
| Reference level : | 40 dBm |
| Reference Level Offset : | Corrected to account for cable(s) and attenuator |
|  | losses |
| Level range : | 90 dB |
| Sweep time : | 25 ms |

### 6.5. NAME OF TEST: 2.1051 SPURIOUS EMISSIONS AT ANTENNA TERMINALS

### 6.5.1 FCC REQUIREMENTS

(e) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power $(\mathrm{P})$ by at least $43+10 \log (\mathrm{P}) \mathrm{dB}$.
(f) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
(g) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.
(h) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

### 6.5.2 TEST RESULTS WITH DUPLEXER CONFIGURATION

The reference level for spurious emissions at the antenna terminals is taken from the measured output power ( $46.4 \mathrm{dBm}=43.6$ Watts).
Therefore the spurious emissions must be attenuated by at least $43+10 * \log (43.6)=59.4 \mathrm{~dB}$. The measured output power was 46.4 dBm ; therefore the limit is $46.4-59.4=-13 \mathrm{dBm}$.

Spurious measurement is performed in the following coupling configuration with 30W Power amplifier and with duplexer.

The nominal GMSK power at antenna connector: Pduplexer max $=47 \mathrm{dBm}$ The nominal 8PSK power at antenna connector: Pduplexer $\max =45.7 \mathrm{dBm}$

Tables 3 and 4 show the results for Spurious Emissions at Antenna Terminals.

Table 3: Test results For GMSK Modulation

|  | Channel | Power emission level | Spurious Emissions Level (dBm) | $\begin{aligned} & \hline \text { Limit } \\ & \text { (dBm) } \end{aligned}$ | Margin (dB) |

| $4 \mathrm{GHz}-12 \mathrm{GHz}$ | -35.2 | 22 |
| $12 \mathrm{GHz}-20 \mathrm{GHz}$ | -34.8 | 22 |

## Notes:

Figures 2,3,4 show sample plots for the case when the transmitter was respectively tuned to edge channels in Tx band for GMSK modulation.

Figures $5,6,7$ show sample plots for the case when the transmitter was respectively tuned to edge channels in Tx band for 8PSK modulation.

Figure $8,9,10$ show sample plots for frequency spans from 0 to 20 GHz with emission on channel 189 at $\operatorname{Pmax}=46.4 \mathrm{dBm}$ with Duplexer module.

## Conclusion:

In GMSK modulation, power has to be reduced by $6 \mathrm{~dB}(\mathbf{P} \max \mathbf{- 6 d B})$ for Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251 in order to meet spurious emission requirement.
In 8PSK modulation, the power has to be reduced by 4 dB ( $\mathbf{P}$ max $\mathbf{- 4 d B}$ ) on these channels.

For Edge Channel ARFCN 238, 241, the maximum power (47dBm) has allowed to meet spurious emission requirement.

### 6.5.3 TEST RESULTS WITH H2D CONFIGURATION

Spurious measurement is performed in the H2D combiner coupling configuration with HePA 60W Power amplifier.

The nominal GMSK power at antenna connector: PH2D max $=44 \mathrm{dBm}$. For H2D configuration, spurious have been measured for channels which have the worst results in Duplexer coupling.

Tables 6 and 7 show the results for Spurious Emissions for GMSK and 8PSK modulation at Antenna Terminals.

Table 6 : Test results For GMSK Modulation with H2D combiner

|  | Channel | Power <br> emission <br> level | Spurious <br> Emissions Level <br> $(\mathbf{d B m})$ | Limit <br> $(\mathbf{d B m})$ | Margin <br> $(\mathbf{d B})$ |

## Conclusion: .

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 2 dB in order to meet spurious emission requirement in GMSK modulation with H2D configuration.

For Edge Channel ARFCN 238, 241, the maximum power (44dBm) has allowed to meet spurious emission requirement.

### 6.5.4 TEST PROCEDURE

The equipment was configured as shown in schematic3.
Schematic3: Test configuration for Spurious emissions at antenna terminals

For adjacent channels emissions, the BTS nominal carrier frequency was adjusted to each block edge channel.

Channels 128 and 251 are those channels which are at the lower and upper edges of the eGSM 850 band respectively.

The BTS was configured to transmit at maximum power (static level 0 ) or a reduced power :

- for GMSK modulation, in mode GMSK no synchro
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5 .

Initially the transmitter was set to operate to maximum power. Then in case of out of limits, the power has been decreased by 2 dB .

For these measurements, the resolution bandwidth was of the spectrum analyzer was set to at least $1 \%$ of the emission bandwidth. In this case the emission bandwidth measured was closed to 300 kHz . Therefore, the resolution bandwidth was set to 3 kHz .

| The spectrum analyzer had the following settings for adjacent band: |  |
| :--- | :--- |
| Resolution bandwidth : | 3 kHz |
| Video bandwidth : | 10 kHz |
| Span : | 1 MHz |
| Reference level : | 30 dBm |
| Reference Level Offset : | Corrected to account for cable(s), filter and |
|  | attenuator losses |
| Level range : | 100 dB |
| Sweep time : | Coupled |
| Detector: | Sample |
| Trace: | Average |
| Sweep count: | 200 |

The spectrum analyzer had the following settings for out of block emissions.
Resolution bandwidth :
1 MHz
Video bandwidth : $\quad 1 \mathrm{MHz}$

The emissions were investigated up to the twentieth harmonic of the fundamental emission ( 20 GHz ).

The measured level of the emissions was recorded and compared to the -13 dBm limit.

### 6.6. NAME OF TEST: 2.1055 FREQUENCY STABILITY

## FCC REQUIREMENTS

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

## FCC RESULTS:

## $>$ BTS S12000 Outdoor :

For Outdoor BTS, the worst thermal case for HePA850 module is S12000 BTS. So frequency stability is measured in the BTS S12000 OUTDOOR with AC supply voltage.

Table 8: Frequency Stability in BTS S12000 Outdoor configuration - Channel 189

|  | Maximum Carrier Frequency <br> Deviation (Hz) |  |  |
| :---: | :---: | :---: | :---: |
| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | $85 \%$ Nominal <br> Supply voltage | Nominal <br> Supply voltage | $115 \%$ Nominal <br> Supply voltage |
|  | 195 V AC | 230 V AC | 264 V AC |
|  | $-12,3$ | 8,8 | 9,8 |
| -30 | $-7,8$ | $-7,8$ | $-9,9$ |
| -20 | 8,5 | $-8,9$ | $-11,4$ |
| -10 | 12,2 | 9,7 | $-9,3$ |
| 0 | $-8,9$ | 10,7 | $-9,1$ |
| 10 | $-10,1$ | 8,1 | $-9,6$ |
| 20 | 12,2 | $-8,5$ | $-11,4$ |
| 30 | 15,2 | $-8,5$ | $-8,7$ |
| 40 | $-8,8$ | $-7,1$ | 11,4 |
| 50 | $-8,3$ | $-9,8$ | 8,46 |

The maximum deviation measured $(\mathbf{1 5} \mathbf{~ H z})$ is fully compliant to FCC to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Outdoor BTS complies with the requirement.

## BTS S12000 Indoor :

For Indoor BTS, the worst thermal case for HePA850 module is S 8000 BTS .

So frequency stability is measured in the BTS S8000 INDOOR in DC supply voltage. The compliance for S8000 Indoor BTS ensures S12000 Indoor BTS compliance.

Table 9: Frequency Stability in quick test bench configuration - Channel 189

| $\begin{gathered} \text { Module } \\ \text { Temperature }\left({ }^{\circ} \mathrm{C}\right) \\ \hline \hline \end{gathered}$ | Maximum Carrier Frequency Deviation (Hz) |  |  |
| :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { DC Voltage } \\ -40 \mathrm{~V} \end{gathered}$ | $\begin{gathered} \text { DC Voltage } \\ -48 \mathrm{~V} \end{gathered}$ | $\begin{gathered} \text { DC Voltage } \\ -57 V \end{gathered}$ |
| -5 | -10.98 | -10.46 | -11.62 |
| 5 | -14.08 | -8.52 | -10.53 |
| 15 | 15.5 | -10.85 | -10.4 |
| 25 | -12.07 | -9.36 | 10.65 |
| 35 | -13.3 | -17.24 | 11.49 |
| 45 | -16.72 | -14.92 | -12.53 |

The maximum frequency deviation allowed is 45 Hz .

The maximum deviation measured $\mathbf{( - 1 7} \mathbf{~ H z})$ is more than sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Indoor BTS still complies with the requirement

## TEST PROCEDURE

Thermal tests have been performed with OUTDOOR S12000 BTS / INDOOR S8000 BTS.
The BTS must operate under the following external extreme temperatures:

- BTS S12000/S8000 Outdoor:
$-40^{\circ} \mathrm{C} /+50^{\circ} \mathrm{C}$
- BTS S12000 /S8000 Indoor:
$-5^{\circ} \mathrm{C} /+45^{\circ} \mathrm{C}$

Frequency stability test is performed under following extreme conditions for Outdoor BTS:

- Temperature from $-40^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ at intervals of 10 degrees.
- With AC power supply variations: 195 VAC, 230 VAC, 264 VAC.

Frequency stability test is performed under following extreme conditions for Indoor BTS:

- Temperature from $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ at intervals of 10 degrees.
- With DC power supply variations: -40.5 VDC, -48 VDC, -57 VDC.

All Modules (eDRX and HePA) run with nominal power regulation at maximum power (60W) in GMSK modulation. The eDRX/HePA were configured to transmit at maximum power (Static level 0).

A period of at least one hour was allowed prior to measurement to ensure that all of the components of the oscillator circuit had stabilized at each temperature.

The equipment was configured as shown in schematic 4 .

Schematic 4 : Test configuration for Frequency Stability

| GSM 850 Tx Filter | NTQA39AA <br> NTQA39BA | Without TOS meter <br> With TOS meter |
| GSM 850 Two Ways Hybrid <br> Duplexer | NTQA38BA <br> NTQA38AA | Without TOS meter <br> With TOS meter |

## Power limitation to comply to Adjacent Band spurious at antenna connector :

| Coupling <br> configuration | System Power limitation <br> GMSK modulation | System Power limitation <br> 8 PSK modulation <br> ( If 8PSK is supported by modules) |
| :---: | :---: | :---: |
| Diplexer <br> Tx Filter | Power Limitation : <br> Pmax $-\mathbf{2 ~ d B ~}=\mathbf{4 2 ~ d B m}$ <br> Except | Power Limitation : <br> Pmax $-\mathbf{2 ~ d B = 4 2 ~ d B m ~}$ <br> Except |
| H2D | ARFCN 238, 241 : Pmax | ARFCN 238, 241: Pmax |

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 2 dB in order to meet spurious emission requirement.

For Edge Channel ARFCN 238, 241, maximum power (44dBm) has allowed to meet spurious emission requirement.

- GSM850 Radio Modules used with 60W Power Amplifier configuration

| Description | Hardware <br> code | Comment |
| :--- | :---: | :---: |

| Radio Modules GSM 850 |  |  |
| :--- | :---: | :--- |
| GSM 850 DRX | NTQA88HA | eDRX |
| GSM 850 Splitter | NTQA88XA |  |
| GSM 850 High Power Amplifier | NTQA50UA | GSM850 HePA (GMSK 60W / 8PSK 45W ) |
| Full Band coupling ( Tx Band 869-894 MHz ) |  |  |
| GSM 850 Duplexer | NTQA38GA <br> NTQA38FA | Without TOS meter <br> With TOS meter |
| GSM 850 Tx Filter | NTQA39CA <br> NTQA39DA | Without TOS meter <br> With TOS meter |
| GSM 850 Two Ways Hybrid <br> Duplexer | NTQA38JA <br> NTQA38HA | Without TOS meter <br> With TOS meter |
| Part Band coupling ( Tx Band 869- 891.5 MHz ) |  |  |
| GSM 850 Duplexer | NTQA38CA <br> NTQA38DA | Without TOS meter <br> With TOS meter |
| GSM 850 Tx Filter | NTQA39AA <br> NTQA39BA | Without TOS meter <br> With TOS meter |
| GSM 850 Two Ways Hybrid <br> Duplexer | NTQA38BA <br> NTQA38AA | Without TOS meter <br> With TOS meter |

## Power limitation to comply to Adjacent Band spurious at antenna connector :

| Coupling <br> configuration | System Power limitation <br> GMSK modulation | System Power limitation <br> 8 PSK modulation |
| :---: | :---: | :---: |
| Diplexer <br> Tx Filter | Power Limitation : <br> Pmax $-\mathbf{6 ~ d B}=40.4 \mathrm{dBm}$ <br> Except <br> ARFCN 238, 241 : Pmax | Power Limitation: <br> Pmax $-\mathbf{4 ~ d B}=41.9 \mathrm{dBm}$ <br> Except |
| H2D | Power Limitation : <br> Pmax $-\mathbf{2 d B}=41.2 \mathrm{dBm}$ <br> Except <br> ARFCN 238, 241: Pmax |  |
|  | ARFCN 238, 241 : Pmax |  |

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 6 dB (GMSK) or 4 dB ( 8 PSK ) in order to meet spurious emission requirement.

For Edge Channel ARFCN 238, 241, maximum power has allowed to meet spurious emission requirement.
