### 1. INTRODUCTION

#### **1.1. OBJECT**

This report presents the test data in accordance with FCC Part 24 Subpart E for the S8000 Indoor and Outdoor Basestations in PCS1900 band configured with:

- a new module introduction : HePA (GMSK 60W / Edge 45W) 1900.
- existing configuration with PA (GMSK 30W / Edge 30W ) 1900 Band only

These results can be applied for mixed BTS configuration 1900 Band PA ( GMSK 30W / Edge 30W ) and HePA ( GMSK  $\,60W$  / Edge 45W)

This report presents also the test data in accordance with FCC Part 22, Subpart H , for the S8000 Indoor and Outdoor Basestations in 850 Band configured with:

- 850 Band only - PA ( GMSK 30W / Edge 30W )

These results can be applied for 1900 / 850 Dual Band BTS configuration :

- 1900/ 850 Dual Band - PA ( GMSK 30W / Edge 30W )

- 1900 Band HePA ( GMSK 60W / Edge 45W ) mixed with 850 Band PA (GMSK 30W / Edge 30W )

This report presents test data for GMSK modulation and 8PSK modulation (EDGE functionality).

#### **1.2. SCOPE**

This document applies to the S8000 BTS GSM 1900/850 Outdoor and Indoor versions.

S8000 BTS can integrate a maximum of 6 HePA modules.

Some RF Tests have been performed in the worst case of BTS configuration: S12000 BTS (equipped with 8HePA).

As we use same modules eDRX, HePA and duplexer in S8000 BTS and S12000 BTS, measurements available in this document done with S12000 BTS can be applied to S8000 BTS.

### 1.3. PRODUCT CONFIGURATIONS

Some Tests were conducted on the Outdoor S12000 BTS with a worst case configuration of 8 HePA modules. As the RF transmit paths are identical in both the Outdoor system and Indoor system, testing has been conducted on the Outdoor version only.

Measurements were taken with all available coupling configurations including with duplexer involves the com pliance with H2D (two input coupler with 3dB loss coupling associated with duplexer) and the H4D configuration (four input coupler with 7dB loss coupling associated with duplexer).

The systems use both GMSK modulation and 8PSK, testing was done with both modulation types.

#### **3.2. DEFINITIONS**

PCS1900 Frequency Band and Channels

| PCS 1900   | C512   | C661 | C810   |
|------------|--------|------|--------|
| F Tx (MHz) | 1930.2 | 1960 | 1989.8 |
| F Rx (MHz) | 1850.2 | 1880 | 1909.8 |

For 512 < n <810

 $F_{Rx}(n) = 1850.2 + 0.2*(n-512)$  $F_{Tx}(n) = F_{Rx}(n) + 80$ 

| IF frequencies on Radio Board: | For Tx path | 299 MHz |
|--------------------------------|-------------|---------|
|                                | For Rx path | 211 MHz |

Clock frequency on the Radio Board 13MHz created from 4.096MHz coming from the Digital board.

#### SSM850 Frequency Band and Channels

| GSM 850    | C128  | C189  | C251  |
|------------|-------|-------|-------|
| Short      | В     | М     | Т     |
| F Tx (MHz) | 869.2 | 881.4 | 893.8 |
| F Rx (MHz) | 824.2 | 836.4 | 848.8 |

For 128 < n <251

 $F_{Rx}(n) = 824.2 + 0.2*(n-128)$ T<sub>Tx</sub>(n) = F<sub>Rx</sub>(n) + 45

| IF frequencies on Radio Board: | For Tx path | 133 MHz |
|--------------------------------|-------------|---------|
| -                              | For Rx path | 71 MHz  |

Clock frequency on the Radio Board 13MHz created from 4.096MHz coming from the Digital board.

### 4. EXHIBIT 1 : TEST REPORT - HEPA PCS1900

#### 4.1. **INTRODUCTION**

The following information is submitted for update of the type acceptance of a Broadband PCS Base Station for Northern Telecom, Inc., in accordance with FCC Part 24, Subpart E and Part 2, Subpart J of the FCC Rules and Regulations.

The measurement procedures were in accordance with the requirements of Part 2.

#### 4.2. MEASUREMENT RESULTS

Table 1 is a summary of the measurement results for this update.

| FCC Measurement<br>Specification     | IC<br>Limit<br>Specification | Description                                | Result   | Note |
|--------------------------------------|------------------------------|--|----------|------|
| 2.1046(a),<br>2.1033(c)(8)<br>24.232 | 6.2                          | RF Power Output                            | Complies |      |
| 2.1049                               |                              | Occupied Bandwidth                         | Complies |      |
| 2.1051, 2.1057<br>24.238             | 6.3<br>6.4                   | Spurious Emissions at<br>Antenna Terminals | Complies |      |
| 2.1055<br>24.235                     | 7.0                          | Frequency Stability                        | Complies |      |

#### Table 1 : Measurement Results Summary

#### 4.3. NAME OF TEST: RF POWER OUTPUT

#### 4.3.1. FCC REQUIREMENTS - FCC PART 24.232

Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. See 24.53 for HAAT calculation method. Base station antenna heights may exceed 300 meters with a corresponding reduction in power. In no case may the peak output power of a base station transmitter exceed 100 watts.

#### 4.3.2. TEST RESULTS

 Table 2 shows the test results of RF Output Power for GMSK modulation with several coupling configurations :

| Radio<br>Channel | Frequency<br>(MHz) | Duplexer<br>Power (dBm) | H2D<br>Power (dBm) | H4D<br>Power | HePA<br>Output Power | Limit<br>(dBm) |
|------------------|--------------------|-------------------------|--------------------|--------------|----------------------|----------------|
|                  |                    |                         |                    | (dBm)        | (dBm)                |                |

#### 4.3.3. TEST PROCEDURE

The equipment was configured as shown in schematic 1.

#### Schematic 1: Test configuration for RF Output Power

The BTS was configured to transmit at maximum power (static level 0) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

Measurements were made at frequencies which are the bottom, middle and top of each of the licensed blocks.

The output power was measured using the power meter which has the following settings :

Mode : Average Reference Level Offset : Corrected to account for cable(s) and attenuator losses

#### 4.4. NAME OF TEST : OCCUPIED BANDWIDTH

#### 4.4.1. FCC REQUIREMENTS

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

#### 4.4.2. TEST RESULTS

The maximum occupied bandwidth was found to be: 320 kHz, measured on channel 661, f=1960 MHz in GMSK modulation, 317 kHz, measured on channel 661, f=1960 MHz in 8PSK modulation.

Figure 2: Sample plot for occupied bandwidth in 8PSK modulation

#### 4.4.3. TEST PROCEDURE

The equipment was configured as shown in schematic 2.

#### **FCC Part 24/Part 22 Test Report for S8000 Indoor and Outdoor Base stations FCC ID#AB6S8000**

The BTS was configured to transmit at maximum power (static level 0) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

The occupied bandwidth was measured by determining the bandwidth out of which all emissions are attenuated at least 26 dB below the transmitter power.

The spectrum analyzer had the following settings :

| Detector :               | Sample  |
|--------------------------|---|
| Trace :                  | Average   |
| Resolution bandwidth:    | 10 kHz  |
| Video bandwidth :        | 30 kHz  |
| Span:                    | 1 MHz   |
| Reference Level Offset : | Corrected to account for cable(s) and attenuator losses |
| Level range :            | 100 dB  |
| Sweep time :             | 25 ms   |

#### 4.5. NAME OF TEST: SPURIOUS EMISSIONS AT ANTENNA TERMINALS

#### 4.5.1. FCC REQUIREMENTS LIMITS – FCC PART 24.238

- (a) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least  $43 + 10 \log (P) dB$ .
- (b) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
- (c) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.
- (d) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

#### 4.5.2. TEST RESULTS WITH DUPLEXER CONFIGURATION

The reference level for spurious emissions at the antenna terminals is taken from the measured output power (46.3 dBm = 42.63 Watts).

Therefore the spurious emissions must be attenuated by at least 43 + 10\*Log(42.63) = 59.3dBThe measured output power was 46.3 dBm ; therefore the limit is 46.3 - 59.3 = -13 dBm.

Spurious measurement is performed with the worst configuration with Duplexer coupling and 60W High Power amplifier .

The Nominal power at antenna connector : PD max =46.5 dBm.

The test compliance with duplexer involves the compliance with H2D (two input coupler with 3dB loss coupling associated with duplexer) and the compliance with H4D configuration (four input coupler with 7dB loss coupling associated with duplexer).

Tables 5 and 6 show the results for Spurious Emissions at Antenna Terminals.

|   | Channel | Power    | Spurious    | Limit (dB) | Margin (dB) |
|---|---------|----------|-------------|------------|-------------|
|   |         | emission | emissions   |            |             |

#### Tables 6: Spurious emissions with the diplexer for 8PSK modulation

#### Notes:

GMSK modulation measurements :

Figures from 3 to 6 show sample plots for the case when the transmitter was tuned with the power reduced by 4 dB in diplexer configuration for differents Edge Channel 512, 585, 737, 810.

8PSK modulation measurements:

Figures from 7 to 10 show sample plots for the case when the transmitter was tuned at the power reduced by 2dB in diplexer configuration.

Out of band measurement in GMSK modulation:

Figures from 11 to 20 show sample plots for frequency spans from 0 to 20 GHz with emission on channel 810 at maximum power with diplexer configuration.

PCS/BTS/DJD/005945

PCS/BTS/DJD/005945

## 4.5.5. CONCLUSION

| Coupling<br>Configuration | Antenna<br>Output | Power reduction<br>Measurement | System Power limitation<br>GMSK modulation |
|---------------------------|-------------------|--------------------------------|--|
| -                         | power (dBm)       | ( qualification modules)       |  |
| Diplexer                  | 46.5              | Pmax - 4 dB = 42.5 dBm         | Pmax - 6 dB = 40.5 dBm                     |
| H2D                       | 43                | Pmax = 43 dBm                  | Pmax - 2 dB = 41 dBm                       |
| H4D                       | 40                | Pmax = 40 dBm                  | Pmax = 40 dBm                              |

#### GMSK modulation:

For system limit, 2dB power reduction margin is taken to ensure the compliance for the case of diplexer and H2D due to eDRX/HePA products tolerances.

In order to comply with the emission limits in the 1 MHz bands immediately outside and adjacent to the frequency block, the absolute transmit power level of the block edge channels has been done at Pmax - 6 dB = 40.5 dBm for the worst case in diplexer configuration.

#### BPSK modulation:

eDRX and HePA 1900 support 8 PSK modulation.

| Coupling | Antenna port<br>Output power | Power reduction<br>measurement | System Power limitation<br>8 PSK modulation |
|----------|------------------------------|--------------------------------|---|
| Diplexer | ( <b>dBm</b> )<br>45.8       | Pmax - 2 dB = 43.8 dBm         | Pmax - 2 dB = 43.8 dBm                      |
| H2D      | 42                           | Pmax = 42 dBm                  | $Pmax = 42 \ dBm$                           |
| H4D      | 39                           | Pmax = 39 dBm                  | Pmax = 39 dBm                               |

In the worst configuration (Diplexer), the maximum power emission with 2dB reduced (**Pmax -2dB**) allows to be compliant with the spurious emission limits (-13 dBm) in the 1 MHz bands immediately outside and adjacent to the frequency blockfor 8PSK modulation.

## 4.5.6. TEST PROCEDURE

The equipment was configured as shown in schematic 3.

Schematic 3 : Test configuration for Spurious emissions at antenna terminals

For adjacent channels emissions, the BTS nominal carrier frequency was adjusted to each block edge channel.

Channels 512 and 810 are those channels which are at the lower and upper edges of the PCS band respectively.

The BTS was configured to transmit at maximum power (static level 0) or a reduced power :

- for GMSK modulation, in mode GMSK no synchro
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5 .

#### **FCC Part 24/Part 22 Test Report for S8000 Indoor and Outdoor Base stations FCC ID#AB6S8000**

For these measurements, the resolution bandwidth of the spectrum analyzer was set to at least 1% of the emission bandwidth. In this case the emission bandwidth measured was closed to 300 kHz. Therefore, the resolution bandwidth was set to 3 kHz.

The spectrum analyzer had the following settings for adjacent band:

| Resolution bandwidth :<br>Video bandwidth :<br>Span : | 3 kHz<br>10 kHz<br>1 MHz  |
|---|---|
| Reference Level Offset :                              | Corrected to account for cable(s), filter and attenuator losses |
| Level range :   | 100 dB  |
| Sweep time :  | Coupled   |
| Detector :  | Sample  |
| Trace :   | Average   |
| Sweep count :   | 200   |

For all other measurements the BTS carrier frequency was adjusted to Channel 810.

| The spectrum analyzer had the following settings | for out of block emissions. |
|--|-----------------------------|
| Resolution bandwidth :                           | 1 MHz                       |
| Video bandwidth :                                | 1 MHz                       |

The emissions were investigated up to the tenth harmonic of the fundamental emission (20 GHz).

The measured level of the emissions was recorded and compared to the -13 dBm limit.

## 4.6. NAME OF TEST: FREQUENCY STABILITY

Frequency stability has been tested in worst BTS configuration (BTS S12000) case for PCS 1900 HePA introduction.

This BTS S12000 compliance ensures the frequency stability compliance for BTS S8000.

Table 6 shows the Frequency Stability for channel 661 (F=1960 MHz) in BTS 12000 OUTDOOR configuration (8 HePA) under extreme conditions.

| Temperature | Maximum Carrier Frequency<br>Deviation (Hz) |                                      |  |  |
|-------------|---|--------------------------------------|--|--|
| (°C)        | 85% Nominal<br>Supply voltage<br>195 V AC   | Nominal Supply<br>voltage<br>230V AC | 115% Nominal<br>Supply voltage<br>264 V AC |  |
| -30         | 50.3  | 56.8                                 | 47.4                                       |  |
| -20         | 56.9  | 56.5                                 | 45.4                                       |  |
| -10         | 57.7  | 56.6                                 | 43.7                                       |  |
| 0           | 62.3  | 49.2                                 | 61.5                                       |  |
| 10          | 49.7  | 54.6                                 | 48.0                                       |  |
| 20          | 49.2  | 58.7                                 | 56.3                                       |  |
| 30          | 56.5  | 49.4                                 | 53.9                                       |  |
| 40          | 58.7  | 71.0                                 | 63.0                                       |  |
| 50          | 60.7  | 61.0                                 | 56.6                                       |  |

 Table 11: Frequency Stability in BTS S12000 Outdoor configuration – Channel661

The maximum frequency deviation allowed is 90 Hz.

The maximum deviation measured (71Hz) is sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S12000 Outdoor BTS complies with the requirement which involves the compliance for BTS S8000.

#### **TEST CONFIGURATION :**

Thermal tests have been performed with OUTDOOR BTS S12000.

The BTS S12000 must operate under the following external extreme temperatures: - BTS S12000 Outdoor :  $-30^{\circ}C / + 50 ^{\circ}C$ 

Frequency stability test is performed under following extreme conditions:

- Temperature from  $-30^{\circ}$ C to  $+50^{\circ}$ C at intervals of 10 degrees.
- With AC power supply variations: 195 VAC, 230 VAC, 264 VAC.

All Modules (eDRX and HePA) run with nominal power regulation at maximum power (60W) in GMSK modulation. The eDRX/HePA were configured to transmit at maximum power (Static level 0).

BTS S12000 is equipped with eDRX/HePA in slots 0, 1, 2, 3, 6, 7, 8, 9 with following emission configuration :

| slot 0 : BCCH $\rightarrow$ | C542 | slot 6 : BCCH $\rightarrow$ | C632 |
|-----------------------------|------|-----------------------------|------|
| slot 1 : TCH $\rightarrow$  | C661 | slot 7 : BCCH $\rightarrow$ | C692 |
| slot 2 : BCCH $\rightarrow$ | C572 | slot 8 : BCCH $\rightarrow$ | C722 |
| slot 3 : BCCH $\rightarrow$ | C602 | slot 9 : BCCH $\rightarrow$ | C752 |

Frequency deviation is measured in slot 1 on channel C661.

A period of at least one hour was allowed prior to measurement to ensure that all the components of the oscillator circuit was stabilized at each temperature.

The equipment was configured as shown in figure 16.

#### Fig ure 16: Test configuration for Frequency Stability

## 5. EXHIBIT 2 : TEST REPORT FOR PCS900 PA 30W

## 5.1. INTRODUCTION

The following information is submitted for update of the type acceptance of a Broadband PCS Base Station for Northern Telecom, Inc., in accor dance with FCC Part 24, Subpart E and Part 2, Subpart J of the FCC Rules and Regulations.

The measurement procedures were in accordance with the requirements of Part 2.

## 5.2. MEASUREMENT RESULTS

Table 1 is a summary of the measurement results for this update.

| FCC Measurement<br>Specification     | IC<br>Limit<br>Specification | Description                                | Result   | Note             |

## 5.4. NAME OF TEST : 2.1049 OCCUPIED BANDWIDTH

### TEST RESULTS

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The maximum occupied bandwidth was found to be:

320 kHz , measured on channel 661, f = 1960.0 MHz  $\,$  GMSK modulation. 318 kHz , measured on channel 661, f = 1960.0 MHz  $\,$  8PSK modulation.

Figure 1: Sample plot for occupied bandwidth . GMSK modulation

#### Figure 2 : Sample plot for occupied bandwidth . 8PSK modulation

## 5.5. SPURIOUS EMISSIONS AT ANTENNA TERMINALS

## **TEST RESULTS**

The reference level for spurious emissions at the antenna terminals is taken from the measured output power (43.9 dBm = 24.5 Watts).

Therefore the spurious emissions must be attenuated by at least 43 + 10\*Log(24.5) = 56.9 dB. The measured output power was 43.9 dBm ; therefore the limit is 43.9 - 56.9 = -13 dBm.

Spurious measurement is performed with the worst configuration with Duplexer coupling and 30W Power amplifier .

The Nominal power at antenna connector : PD max =44dBm. The test compliance with duplexer involves the compliance with H2D (two input coupler with 3dB loss coupling associated with duplexer) and the compliance with H4D configuration (four input coupler with 7dB loss coupling associated with duplexer).

Tables 3 and 4 show the results for Spurious Emissions at Antenna Terminals.

|   | Channel | Power<br>emission<br>level | Spurious<br>Emissions Level<br>(dBm) | Limit<br>(dBm) | Margin<br>(dB) |

#### **Conclusion :**

| Coupling configuration | System Power limitation<br>GMSK modulation | System Power limitation<br>8 PSK modulation<br>( If 8PSK is supported by modules) |
|------------------------|--|---|
| Diplexer<br>Tx Filter  | Power Limitation :<br>Pmax – 4 dB = 40 dBm | Pmax= 44 dBm  |
| H2D                    | Pmax = 41  dBm                             | Pmax= 41 dBm  |
| H4D                    | Pmax = 37 dBm                              | Pmax = 37 dBm   |

| Table 6 : Edge channel | <b>Power limitation</b> | for PCS1900 | 30W emission. |
|------------------------|-------------------------|-------------|---------------|
|------------------------|-------------------------|-------------|---------------|

#### GMSK modulation:

The worst case is the Duplexer configuration and emission power has been done at PD max -4dB = 40 dBm

In order to comply with the emission limits in the 1 MHz bands immediately outside and adjacent to the frequency block, the absolute transmit power level of the block edge channels is set to **40 dBm** for GMSK modulation.

#### 8PSK modulation:

eDRX and eSCPA 1900 support 8 PSK modulation.

In the worst configuration (Diplexer), **maximum emission power P=44 dBm** allows to be compliant with the spurious emission limits (-13 dBm) in the 1 MHz bands immediately outside and adjacent to the frequency block for 8PSK modulation.

## 5.6. NAME OF TEST : 2.1055 FREQUENCY STABILITY

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

## TEST RESULTS:

Table 7 shows frequency stability checked during DRX New Design introduction [R2].

| Temperature | Maximum Carrier Frequency<br>Deviation (Hz) |                                      |  |  |

#### **FCC Part 24/Part 22 Test Report for S8000 Indoor and Outdoor Base stations FCC ID#AB6S8000**

The maximum frequency deviation allowed is 89 Hz.

The maximum deviation measured 73Hz is more than sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S8000 Outdoor/Indoor BTS still complies with the requirement.

## TEST PROCEDURE

Thermal tests has been performed with modules eDRX with eSCPA inside BTS8000. These tests have shown that thermal features of eDRX/eSCPA were equivalent or better than old DRX and PA versions inside BTS S8000 in extreme conditions.

The BTS S8000 must operate in following external extreme temperatures:

- BTS S8000 Indoor : - 5°C / +45 °C - BTS S8000 Outdoor : -40°C / +50°C

These external temperature ranges involve the extreme temperature range from  $-5^{\circ}$ C to  $+65^{\circ}$ C on eDRX and eSCPA modules.

Frequency stability are checked in BTS S8000 Indoor at ambient temperature.

Frequency stability test is also performed with a quick test bench for module configuration in following extreme conditions :

- > Temperature from -5 to +65 centigrade at intervals of 10 centigrades
- With DC power supply variations eSCPA (-36V/-60V) and eDRX (-40V/-57V)

Modules (eDRX – eSCPA ) run with nominal power regulation at maximum power (30W) in GMSK modulation.

The eDRX/eSCPA was configured to transmit at maximum power (Static level 0).

A period of at least one hour was allowed prior to measurement to ensure that all of the components of the oscillator circuit had stabilized at each temperature.

# FCC Part 24/Part 22 Test Report for S8000 Indoor and Outdoor Base stations FCC ID#AB6S8000

The equipment was configured as shown in figure 11.

Figure 12 : Test configuration for Frequency Stability

## 6. EXHIBIT 3: TEST REPORT - PA30W GSM850

## 6.1. INTRODUCTION

The following information is submitted for update of the type acceptance of a Broadband GSM Base Station for Nortel Networks, in accordance with FCC Part 22, Subpart H and Part 2, Subpart J of the FCC Rules and Regulations. The measurement procedures were in accordance with the requirements of Part 2.999.

## 6.2. MEASUREMENTS RESULTS

Table 1 is a summary of the measurement results for this update.

| FCC Measurement<br>Specification | IC Limit<br>Specification<br>RSS 128<br>Section | Description                                | Result   |
|----------------------------------|---|--|----------|
| 2.1046                           | 7.1   | RF Power Output                            | Complies |

 Table 1 : Measurement Results Summary

Measurements in GSMK modulation for GSM 850 Band are available in document [R7].

Additional GMSK tests are performed for the Edge channel of sub-band A", A, B, A', B'.

Additional Tests are also performed in 8PSK modulation.

## 6.3. NAME OF TEST: 2.1046 RF POWER OUTPUT

## FCC REQUIREMENTS

## 4.3.1.1. FCC PART 22.913

- (a) Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. See 24.53 for HAAT calculation method. Base station antenna heights may exceed 300 meters with a corresponding reduction in power. In no case may the peak output power of a base station transmitter exceed 500 watts.
- (b) Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rmsequivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true peak measurement for the emission in question over the full bandwidth of the channel.

Table 2 shows the test results for RF Output Power.

## **TEST PROCEDURE**

The equipment was configured as shown in schematic 1.

#### Schematic 1: Test configuration for RF Output Power

The BTS was configured to transmit at maximum power (static level 0) :

- for GMSK modulation, in mode GMSK no synchro,
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5.

Measurements were made at frequencies which are the bottom and top of each of the licensed blocks.

The output power was measured using the power meter which has the following settings :

Mode : Average Reference Level Offset : Corrected to account for cable(s) and attenuator losses

## 6.4. NAME OF TEST: 2.1049 OCCUPIED BANDWIDTH

## FCC REQUIREMENTS

## 4.4.1.1. FCC PART 2.1049

The occupied bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

## **TEST RESULTS**

#### Figure 1: sample plot for occupied bandwith

The maximum occupied bandwidth was found 320 kHz for GMSK modulation The maximum occupied bandwidth was found 314 kHz for 8PSK modulation

## **TEST PROCEDURE**

The equipment was configured as shown in schematic 2.

#### Schematic 2: Test configuration for Occupied bandwidth

The BTS was configured to transmit at maximum power (Static Level 0). Measurements were made at frequencies which were at the bottom and top of the transmit band.

The occupied bandwidth was measured by determining the bandwidth out of which all emissions are attenuated at least 26 dB below the transmitter power.

The spectrum analyzer had the following settings :

| Resolution bandwidth :<br>Video bandwidth :                             | 10 kHz<br>30 kHz   |
|---|--|
| Span :  | 1 MHz and 2.2 MHz  |
| Reference level:  | 40 dBm   |
| Reference Level Offset :  | Corrected to account for cable(s) and attenuator   |
|   | losses   |
| Level range :   | 90 dB  |
| Sweep time :  | 25 ms  |
| Span :<br>Reference level:<br>Reference Level Offset :<br>Level range : | 1 MHz and 2.2 MHz<br>40 dBm<br>Corrected to account for cable(s) and attenuator<br>losses<br>90 dB |

## 6.5. NAME OF TEST: 2.1051 SPURIOUS EMISSIONS AT ANTENNA TERMINALS

## FCC REQUIREMENTS

- (c) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB.
- (d) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
- (e) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges, both upper and lower, as the design permits.
- (f) The measurements of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

## **TEST RESULTS**

The reference level for spurious emissions at the antenna terminals is taken from the measured output power (43.9 dBm = 24.5 Watts). Therefore the spurious emissions must be attenuated by at least 43 + 10\*Log(24.5) = 56.9 dB. The measured output power was 43.9 dBm ; therefore the limit is 43.9 - 56.9 = -13 dBm.

Spurious measurement is performed in the following coupling configuration with 30W Power amplifier and with duplexer.

The nominal power at antenna connector : Pduplexer max = 44dBm

Tables 3 and 4 show the results for Spurious Emissions at Antenna Terminals.

|     | Channel | Power<br>emission<br>level | Spurious<br>Emissions Level<br>(dBm) | Limit<br>(dBm) | Margin<br>(dB) |

#### Notes:

Figures 2,3,4 show sample plots for the case when the transmitter was respectively tuned to edge channels in Tx band for GMSK modulation.

Figures 5,6,7 show sample plots for the case when the transmitter was respectively tuned to edge channels in Tx band for 8PSK modulation.

Figure 8,9,10 show sample plots for frequency spans from 0 to 20 GHz with emission on channel 189 at Pmax = 44 dBm with Duplexer module.

## Conclusion : \_.

For both modulation GMSK and 8PSK, the worst case is the Duplexer configuration and it has been done at PD max - 2dB = 42 dBm.

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 2dB in order to meet spurious emission requirement.

## For Edge Channel ARFCN 238, 241, the maximum power (44dBm) has allowed to meet spurious emission requirement.

The H2D configuration has been done at maximum power PH2Dmax =44 dBm.

## **TEST PROCEDURE**

The equipment was configured as shown in schematic3.

For adjacent channels emissions, the BTS nominal carrier frequency was adjusted to each block edge channel.

Channels 128 and 251 are those channels which are at the lower and upper edges of the eGSM 850 band respectively.

The BTS was configured to transmit at maximum power (static level 0) or a reduced power :

- for GMSK modulation, in mode GMSK no synchro
- for 8PSK modulation, in mode logical PDCH, Type GPRS, coding MCS5 .

Initially the transmitter was set to operate to maximum power. Then in case of out of limits, the power has been decreased by 2 dB.

For these measurements, the resolution bandwidth was of the spectrum analyzer was set to at least 1% of the emission bandwidth. In this case the emission bandwidth measured was closed to 300 kHz. Therefore, the resolution bandwidth was set to 3 kHz.

| The spectrum analyzer had th | e following settings for adjacent band:       |
|------------------------------|---|
| Resolution bandwidth :       | 3 kHz   |
| Video bandwidth :            | 10 kHz  |
| Span :                       | 1 MHz   |
| Reference level:             | 30 dBm  |
| Reference Level Offset :     | Corrected to account for cable(s), filter and |
|                              | attenuator losses                             |
| Level range :                | 100 dB  |
| Sweep time :                 | Coupled                                       |
| Detector:                    | Sample  |
| Trace:                       | Average                                       |
| Sweep count:                 | 200   |

The spectrum analyzer had the following settings for out of block emissions.

| Resolution bandwidth : | 1 MHz |
|------------------------|-------|
| Video bandwidth :      | 1 MHz |

The emissions were investigated up to the twentieth harmonic of the fundamental emission (20 GHz).

The measured level of the emissions was recorded and compared to the -13 dBm limit.

## 6.6. NAME OF TEST: 2.1055 FREQUENCY STABILITY

## FCC REQUIREMENTS

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

## **TEST RESULTS**

Table 7 shows Frequency Stability in BTS S8000 Outdoor at ambient temperature for<br/>channels B,M,T.

### Table 6: Frequency Stability in quick test bench configuration – Channel 189

| Module           | Maximum Carrier Frequency<br>Deviation (Hz) in quick test bench configuration |       |       |
|------------------|---|-------|-------|
| Temperature (°C) |   |       |       |
| -5               | -6.91   | 6.91  | 5.94  |
| 5                | -7.75   | -9.3  | -7.17 |
| 15               | 8.85  | 7.1   | -9.1  |
| 25               | -7.81   | -9.17 | 8.14  |
| 35               | -9.04   | -7.81 | -9.43 |
| 45               | -7.68   | -7.49 | 8.52  |
| 55               | -8.78   | -7.43 | -6.84 |
| 65               | -8.52   | -9.88 | -7.68 |

#### Table 7 : Frequency Stability in BTS S8000 Outdoor at ambient temperature

|         | Maximum Carrier Frequency Deviation (Hz) in BTS Configuration |     |    |  |
|---------|---|-----|----|--|
|         | Ambient temperature   |     |    |  |
| Channel | C128 (f=869.2 MHz) C189 (f=881.4 MHz) C251 (f= 893.8 MHz)     |     |    |  |
|         | -9  | -11 | +9 |  |

The maximum frequency deviation allowed is 90 Hz.

The maximum deviation measured (-11Hz) is more than sufficient to ensure that the fundamental emission stays within the authorized frequency block.

The S8000 Indoor BTS still complies with the requirement.

## TEST PROCEDURE

The BTS S8000 must operate in following external extreme temperatures:

| - BTS S8000 Indoor:  | - 5°C / + 45 °C |
|----------------------|-----------------|
| - BTS S8000 Outdoor: | - 40°C / + 50°C |

These external temperature ranges involve the extreme temperature range from -  $5^{\circ}$ C to +65°C on eDRX and eSCPA modules.

Frequency stability are checked in BTS S8000 Outdoor at ambient temperature.

Frequency stability test is performed with a Quick Test Bench for module configuration in following extreme conditions:

- Temperature from -5 to +65 centigrades at intervals of 10 centigrades
- With DC power supply variations eSCPA (-36V/-60V) and eDRX (-40V/-57V)

Modules (eDRX and eSCPA ) run with nominal power regulation at maximum power (30W) in GMSK modulation.

The eDRX/eSCPA were configured to transmit at maximum power (Static level 0).

A period of at least one hour was allowed prior to measurement to ensure that all of the components of the oscillator circuit had stabilized at each temperature.

The equipment was configured as shown in schematic 4.

## Schematic4: Test configuration for Frequency Stability

## 7. MEASUREMENT EQUIPMENT LIST

| <b>Equipment description</b> | Manufacturer | Model            | Serial No. | V/A date |
|------------------------------|--------------|------------------|------------|----------|
|                              |              |                  |            |          |
| Power Meter                  | Giga-tronics | 8542C            | 515956     | 04/2003  |
| Programmable AC source       | Chroma       | Model 6590       | 57220073   | 04/2004  |

## Power limitation to comply to Adjacent Band spurious at antenna connector :

| Coupling<br>configuration | System Power limitation<br>GMSK modulation                                     | System Power limitation<br>8 PSK modulation<br>( If 8PSK is supported by modules) |
|---------------------------|--|---|
| Diplexer<br>Tx Filter     | Power Limitation :<br>Pmax – 2 dB = 42 dBm<br>Except<br>ARFCN 238 , 241 : Pmax | Power Limitation :<br>Pmax – 2 dB = 42 dBm<br>Except<br>ARFCN 238 , 241 : Pmax    |
| H2D                       | Pmax = 41 dBm  | Pmax= 41 dBm  |

For Edge Channel ARFCN 128, 131, 133, 181, 183, 231, 233, 251, power has to be reduced by 2dB in order to meet spurious emission requirement.

# For Edge Channel ARFCN 238, 241, maximum power (44dBm) has allowed to meet spurious emission requirement.
