1.2 Preface

This report documents product testing conducted to verify compliance of the specified EUT with applicable standards and requirements as identified herein. EUT, test instrument configurations, test procedures, and recorded data are generally described in this report. The reader is referred to the applicable test standards for detailed procedures. The following table summarizes the test results obtained during this evaluation.

1.3 Test Result Summary Table

The ARRIS Model Spectrum 110A Set Top Box was tested to the following standards:

FCC Part 15, Subpart C Intentional Radiators	Test Description	Result
15.31(m)	Number of Operating Frequencies	PASS
15.203	Antenna Restrictions	PASS
15.204	Antenna Identification	PASS
15.205	Restricted Bands of Operation	PASS
15.207(b)	Conducted Emissions Power Leads 150 kHz to 30 MHz	PASS
15.209(a)	Spurious Radiated Emissions, 30 MHz to 25 GHz	PASS
15.247(a)(1)	Carrier Frequency Separation	PASS
15.247(a)(1)(iii)	Number of Hopping Frequencies	PASS
15.247(a)(1)(iii)	Time of Occupancy (Dwell Time)	PASS
FCC DA 009705, ANSI C63.10 (6.9.2)	20 dB Bandwidth	PASS
15.247(b)(1)	Maximum Peak Power Output	PASS
15.247(d)	Band Edge Measurement	PASS
15.247(f)	Antenna Port, Power Spectral Density	PASS

Interpretation of Test Results: Where required, the EUT was tested in three modulation schemes; GFSK, QPSK and 8PSK. Also, each modulation scheme was tested at low, middle and high channel frequencies. The resultant data is presented by showing the worst case levels for each modulation type and/or frequency. All recorded results are maintained at BEC Inc.

1.4 Measurement Uncertainty

Measurement	Measurement Distance	Frequency Range	Measurement Limit	Expanded Uncertainty
Conducted Disturbance	N/A	150 kHz – 30 MHz	FCC Section 15.207	3.43
Radiated Disturbance	3 Meter	30 MHz – 1 GHz	FCC Section 15.209	4.50

No adjustments to measured data presented in this report are required because all values of uncertainty are less than the CISPR 16-4-2:2011 recommendations. These uncertainties have a coverage factor of $k = 2$, which yields approximately a 95% level of confidence for the near-normal distribution typical of most measurement results.

FCC Registered Test Site Number: US1118

1.5 Condition of Received Sample

An evaluation of the EUT was conducted in order to verify test subject identity and condition and to ensure suitability for testing. No evidence of physical damage was noted. The test item condition was deemed acceptable for the performance of the requested test services.

1.6 Climatic Environment

Unless noted elsewhere in this report, the following were the ambient conditions in the laboratory during testing:

Temperature: $22^{\circ} \pm 5^{\circ}$

Humidity: $50\% \pm 20\%$

Barometric Pressure: $1000\text{mb} \pm 20\%$

1.7 Test Equipment

All test equipment is checked to manufacturer's specifications and, when applicable, have current N.I.S.T. traceable, ISO 9002 conforming certificates of calibration. Test equipment used for the tests described herein is listed in Appendix A.

2.0 Equipment Under Test

Unless otherwise noted in the individual test results sections, testing was performed on the EUT as follows.

2.1 EUT Description

The Spectrum product line includes the Spectrum 110A and Spectrum 210A. Both products are video home set tops with a wideband QAM tuner capable of up to 4 tunes. Video display capability is max 1080P60. Both products have fully compliant DOCSIS 3.0 embedded cable modems. The Spectrum 110A is capable of pause/live TV with internal SD card. The Spectrum 210A is capable of up to 4 DVR recordings with included HDD. Both products have capsense menu keys with Bluetooth and RF4CE wireless technologies.

2.2 Product Category

FCC Part 15, Subpart C (Section 15.247)

2.3 Product Classification

Intentional Radiator Testing Requirements DSS for Frequency Hopper Operation within the band of 2400 - 2483.5 MHz.

2.4 Test Configuration

The antenna within the ARRIS Spectrum 110A Set Top Box was controlled by software which allowed selection of frequency hopping (BR-Basic Rate of 1 Mbps or EDR-Enhanced Data Rate of 2 Mbps). When selecting specific transmission frequencies the software allows the technician to select Modulated or Un-modulated signals with choices of QPSK, GFSK or 8PSK Modulation Signatures. Output power was controlled as 1-Low, 2-Medium or 3-Maximum Output Power. Maximum Output was selected for all testing.

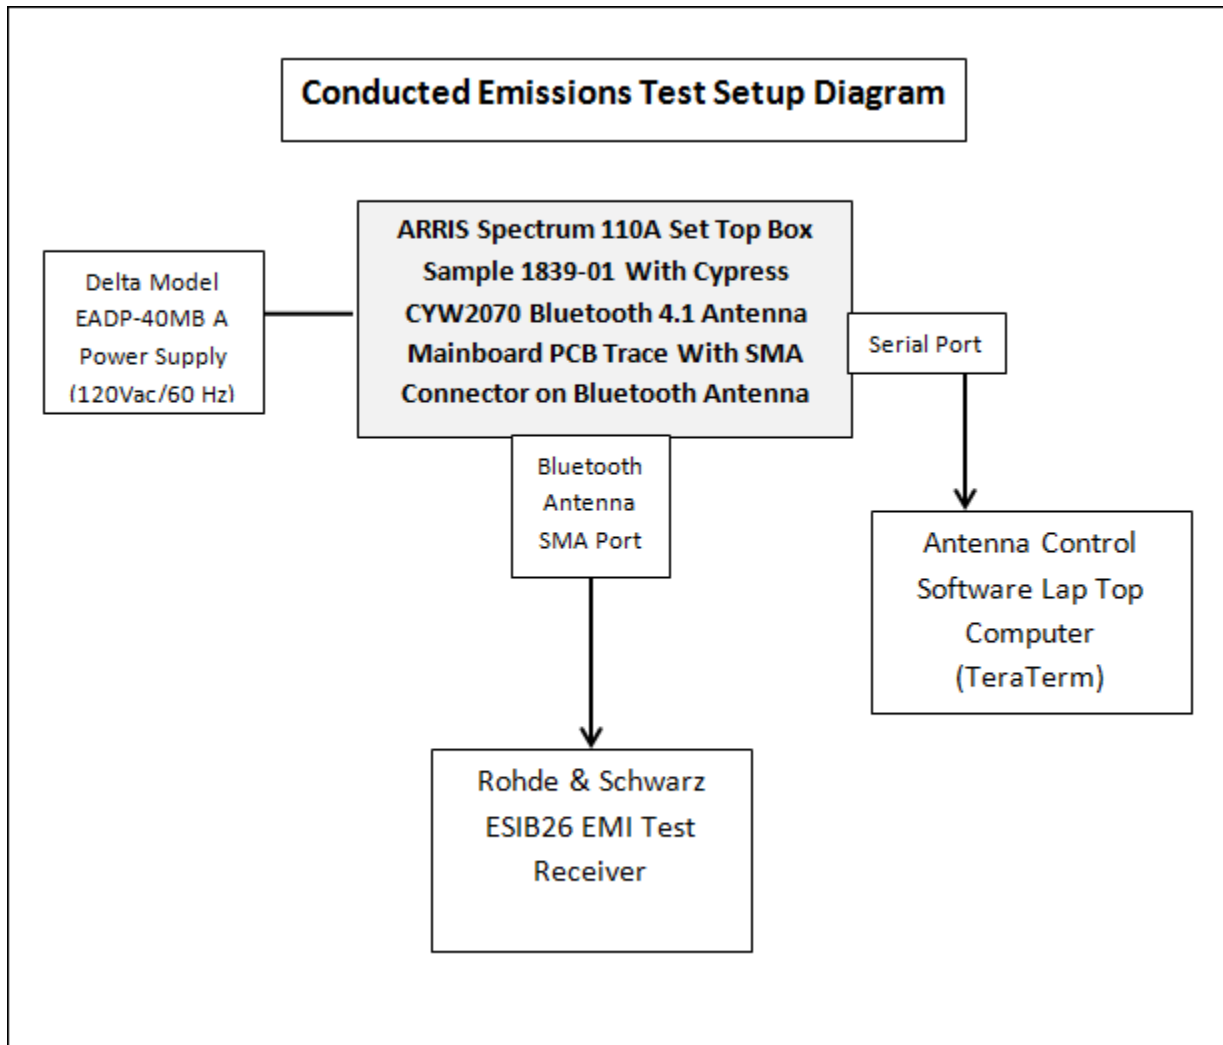

2.5 Test Configuration Rationale

The tested configuration of the EUT was required so that the test technician could view the characteristics of the antenna at specific frequencies and allow the technician to record the required measurements.

2.6 Test Configuration Diagram (Transmitter Conducted Measurements)

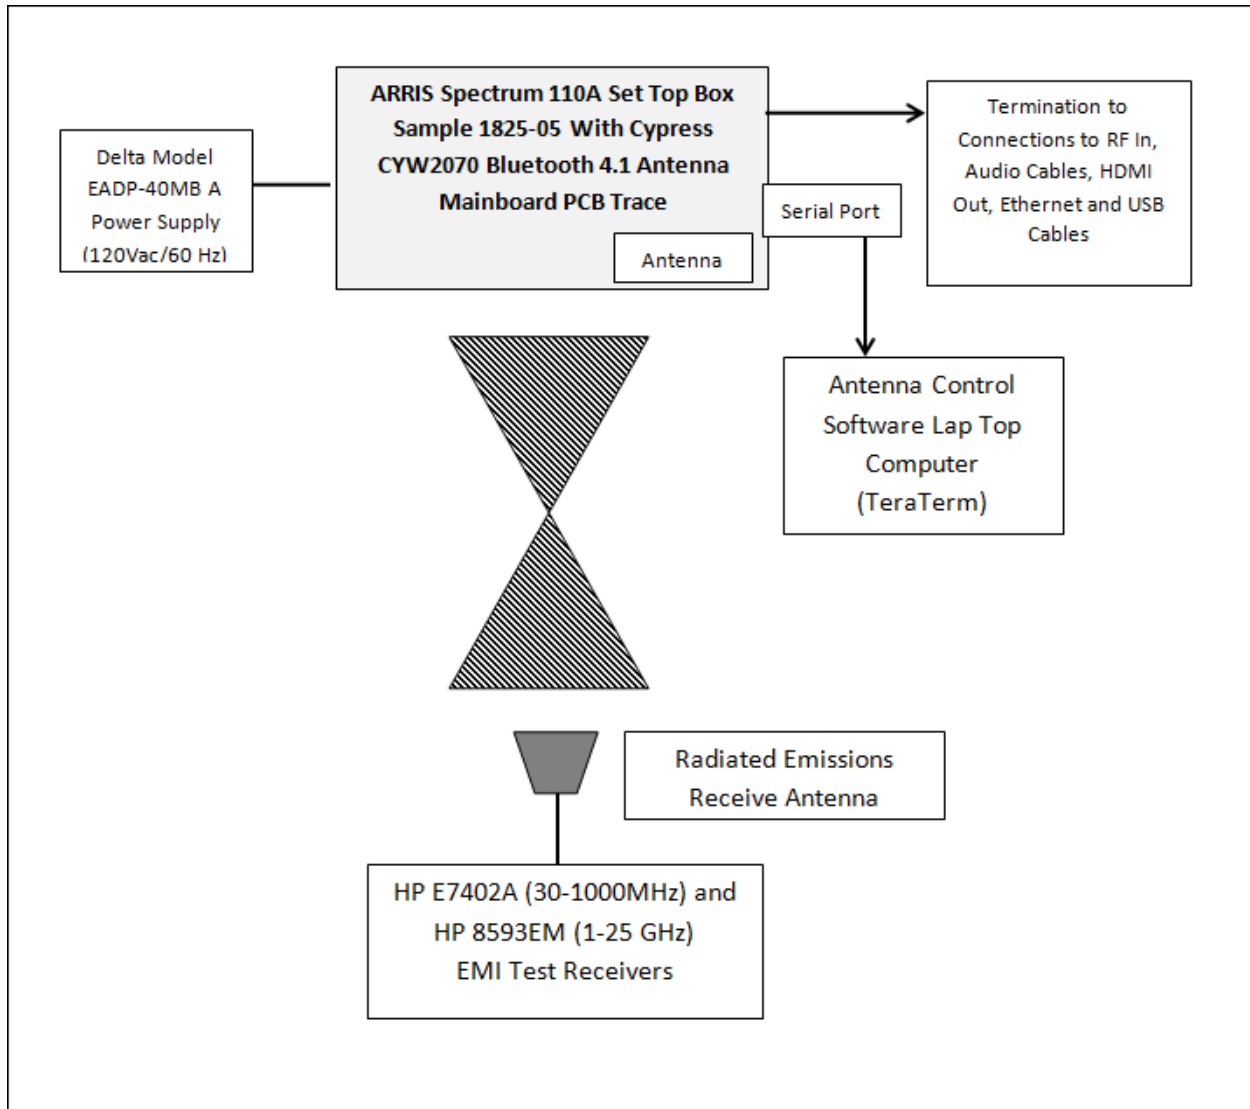

A block diagram of the EUT configuration showing interconnection cables is illustrated below. The drawing shows the physical hardware layout used for the tests along with I/O cables and AC power distribution.

2.7 Test Configuration Diagram (Radiated/Conducted Measurements)

Demonstration of compliance of intentional radiators that operate in a frequency range greater than 10 MHz shall test three frequencies, 1 near top, 1 near middle and 1 near bottom of range. The frequencies of 2.402, 2.440 and 2.480 GHz were selected for testing of the ARRIS Spectrum 110A.

4.2 Antenna Requirement (47 CFR 15.203)

The antenna used by the ARRIS Spectrum 110A is a short trace on the main PCB of the EUT. There are no detachable parts of the antenna. The antenna is not replaceable, nor changeable, and therefore complies with the requirements of this section.

4.3 External RF power amplifiers and antenna modifications (47 CFR 15.204)

There are no RF power amplifier kits available to be used with the ARRIS Spectrum 110A. There are no detachable parts of the antenna. The antenna is not replaceable, nor changeable, and therefore complies with the requirements of this section.

4.4 Restricted Bands of Operation 30 MHz - 25 GHz (47 CFR 15.205)

The emissions from the ARRIS Spectrum 110A, which fall in the restricted bands of operation, detailed in this section, comply with the limits of 15.209. The combinations of frequency and modulation that produced the highest emissions are shown. The EUT operated at maximum RF output at Low Frequency (LF) 2.402 MHz, Middle Frequency (MF) 2.440 GHz and High Frequency (HF) 2.480 GHz. GFSK (Gaussian Frequency Shift Keying), QPSK (Quadrature Phase Shift Keying) and 8PSK (Eight Phase Shift Keying) modulation methods were examined at each frequency.

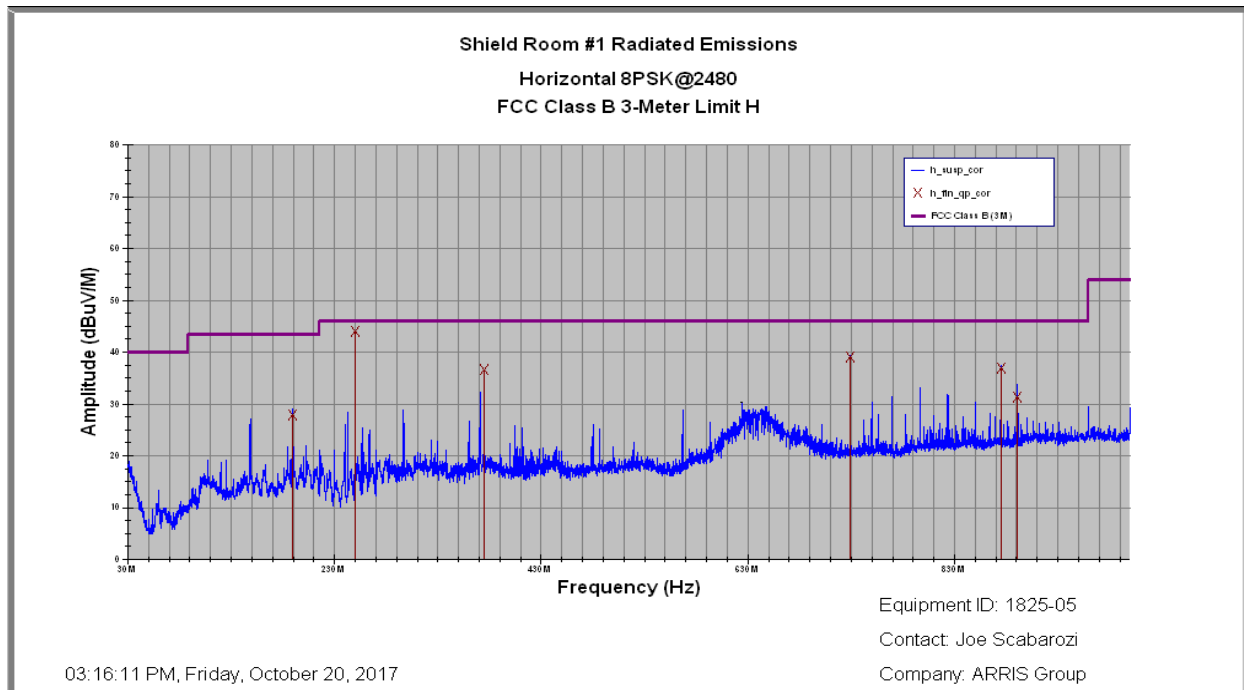

Measurement of the signals was performed with the EUT on a turntable and a variable height antenna mast at 3 meters distance. The signals residing in restricted bands of operation were the second harmonic of the carrier. The table below shows the highest emission measured among the nine combinations of frequency and modulation.

4.4.1 Restricted Bands of Operation (47 CFR 15.205) 30 MHz – 1000 MHz

The table below shows the radiated emissions between 30 MHz and 1 GHz of the ARRIS Spectrum 110A measured at a distance of 3 meters. The emissions were measured for each of the high, middle and low transmitter frequencies and with each of the three modulation types. From the total of the nine possible tables, the transmitter frequency of 2.480 GHz with 8PSK modulation showed the highest emissions.

4.5 Conducted Emissions AC power leads (47 CFR 15.207(b))

AC Power Line

Conducted emissions at the power line input of the EUT were measured with an EMI receiver set to the appropriate detector and CISPR bandwidth, which was connected to the RF output of a 50 Ω , 50 μ H Line Impedance Stabilization Network (LISN) installed in each power line. Measurements were made over the frequency range of 150 kHz to 30 MHz while the EUT was operating as described in the EUT section of this report. The significant amplitudes of emissions measured on the AC power lines of the EUT were recorded as follows:

Emission (dB μ V) = Meter Reading (dB μ v) + Cable Loss (dB) + LISN Factor (dB) + Limiter Loss (dB)

4.5.4 Conducted Emissions AC power leads (47 CFR 15.207(b)) Test Setup Picture

4.6 Spurious Radiated Emissions 1 – 25 GHz (47 CFR 15.209(a))

SR#1

The Semi-Anechoic Shielded Room (SR#1) is an ferrite and absorber lined chamber which houses a 5-foot diameter turntable capable of rotating equipment 360 degrees and antenna mast for Horizontal and Vertical polarity measurements. The enclosure is free of reflective metallic objects and extraneous electromagnetic signals. This 3 meter shielded enclosure has a raised computer floor with metal tile bottoms providing a continuous ground plane.

Instrumentation for remote control of the antenna mast, turntable, and other equipment are controlled by personnel outside the chamber. The EUT and support peripherals required for EUT operation were placed on a table 80 cm high for tabletop equipment or directly on the turntable surface for floor standing equipment.

The test site complies with the attenuation measurements specified in ANSI C63.4:2014

Radiated Emissions 1 – 40 GHz

The EMI receiver was set to quasi-peak mode for frequencies from 30MHz to 1GHz and the appropriate CISPR bandwidths were employed. The receiver was set to average mode for frequencies above 1GHz with the appropriate CISPR bandwidths were employed. Significant emissions found during the preliminary scans were maximized by rotating the turntable and varying the antenna height. Both horizontal and vertical antenna polarities were also investigated for suspect emissions. The signals are maximized and measured using the in house generated RADE or off the shelf TILE software. The support equipment and test item(s) were powered off in turn to determine the source of the emissions where appropriate.

Field strengths were calculated as follows:

Field Strength (dB μ V/m) = Meter Reading (dB μ V) + Antenna Factor (dB/m) + Cable Loss (dB) – Amplifier Gain (dB)

4.6.1 Spurious Radiated Emissions 1 – 25 GHz Measurement

The spurious signal measurements made above 1 GHz are the same measurements made for 47 CFR Part 15.205. The detected signals were the second and third harmonics of the radio transmitter frequency. The levels were measured at low, middle and high frequencies utilizing GFSK, QPSK and 8PSK modulation. Data for 1 to 18 GHz measurements are shown in section 4.6.2. There were no measurable signal from 18 to 25 GHz but all scans are on record at BEC as proof of measurements made for all modulation schemes at low, middle and high frequencies. Data is deliverable upon request.

4.7 Carrier Frequency Separation (47 CFR 15.247(a)(1)) (10/10/2017)

Hopping Channels must be separated by a minimum of 25 kHz or 2/3 of the 20 dB bandwidth whichever is greater. The first table shows the 2/3 value of the 20 dB bandwidths of each low, middle and high frequencies with the three types of modulation from Section 4.10. Basic Data Rate (BDR) speed is 1 Mbps (Megabits per second) and uses GFSK modulation. Enhanced Data Rate (EDR) is 2 Mbps. The measured channel separation is shown on the screen graph and table depicted below.

	BDS	EDS
(MHz)	(MHz)	(MHz)
0.930	1.0280	1.0280

Test Results: The Channel spacing for BDR and EDR Modes are 1.0280 MHz respectively. These values are greater than the minimum 2/3 value of the 20 dB bandwidth required by 47 CFR Part 15.246 (a)(1).

4.8 Number of Hopping Frequencies (47 CFR 15.247(a)(1)(iii)) (10/10/2017)

The hopping frequencies utilized by the ARRIS Spectrum 110A were measured directly from the transmitter output of the EUT for BDR and EDR. The displays captured from the Spectrum Analyzer show the range of 2.402 to 2.480 using two separate scans for each transmission rate.

BDR (Basic Data Rate) 1 Mbps 2402 to 2440 MHz

BDR (Basic Data Rate) 1 Mbps 2440 to 2480 MHz

EDR (Enhanced Data Rate) 2 Mbps 2402 to 2440 MHz

EDR (Enhanced Data Rate) 2 Mbps 2440 to 2480 MHz

Test Results: The number of hopping frequencies is 79 for both BDR and EDR modes. This complies with the requirements of 47 CFR 15.247(a)(1)(iii).

4.9 Time of Occupancy (Dwell Time) (47 CFR 15.247(a)(1)(iii)) (10/10/2017)

Section (a)(1)(iii) of 15.247 requires the average occupancy time of the hopping frequency system shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed (79 channels). The following displays show the measured occupancy time for both data rates.

BDR (Basic Data Rate) 1 Mbps (2.9098 ms)

EDR (Enhanced Data Rate) 2 Mbps (2.9098 ms)

Date: 10.OCT.2017 13:10:05

4.9.1 Time of Occupancy (Dwell Time) (47 CFR 15.247(a)(1)(iii)) Summary Table

The calculation to determine occupancy time:

79 Hopping Channels X .4 seconds = 31.6 maximum transmission time. DH5 packet utilizes 5 time slots. The hopping rate is 1600 hops/second. Maximum dwell is $5/1600 = 3.125$ ms. DH5 maximum hops per second is 1600 hops/second, 79 channels, 6 time slots (5Tx, 1Rx); $1600/79/6 = 3.37$ hops/second in each channel. Dwell time: hops/sec each channel (3.37 ms) X maximum transmission time (31.6) = 106.6.

Test Results: The ARRIS Model Spectrum 110A is measured for its 20 dB bandwidth in each of the modulation configurations and is then used to calculate the channel separation in section 4.7. The above screen captures show each modulation configuration when tested at 2402 MHz. The other Frequencies of 2440 MHz and 2480 MHz were measured and screen captures are on file with BEC Incorporated.

4.11 Maximum Peak Power Output, 47 CFR 15.247(b)(1)

The maximum peak power output level was compliant to the 1 Watt limit imposed by 47 CFR Part 15.247 (b)(1).

4.12 Band Edge Measurement (47 CFR 15.247(d))

The demonstration of band-edge compliance is shown by two spectrum analyzer screens. The SA bandwidth is 100 kHz. One screen shows the peak emission within the operating range of the ARRIS Model Spectrum 110A 2.4 – 2.4835 GHz. The second screen shows the peak level of all other emissions in the 30 MHz to 25 GHz span using the 100 kHz bandwidth and the limit set to 20 dB below the maximum in-band peak level. Measurements were taken with and without frequency hopping. Both BDR (Basic Data Rate) and EDR (Enhanced Data Rate) modes were tested.

Test Results: The ARRIS Model Spectrum 110A demonstrates that all emissions in a 100 kHz band, outside the operating band are more than 20 dB below the 100 kHz bandwidth emission inside the operating band. This complies with the requirements of 47 CFR Part 15.247(d).

Additionally radiated emissions which fall in the restricted bands of section 15.205(a) must comply with the radiated emission limits specified in 15.209(a).

The ARRIS Model Spectrum 110A was tested for compliance to the limits of 15.209(a). The modulation schemes were tested at each of the low, middle and high channel frequencies. The highest emissions were noted with 8PSK with the transmitter at 2.480 GHz. There was little variation in signal quantity or amplitude among the various combinations of frequency and modulation. The tables and graphs below shows the highest emissions.

4.13 Antenna Port, Power Spectral Density (47 CFR 15.247(f)) (10/10/2017)

The ARRIS Model Spectrum 110A employs a combination of both frequency hopping and digital modulation techniques. Therefore, the power spectral density, conducted from the transmitter to the antenna due to the digital modulation operation of the hybrid system, with the frequency hopping operation turned off shall not be greater than 8 dBm in any 3 kHz band during continuous transmission.
