# **FCC DFS Test Report**

FCC ID : ACQ-VIP6102W

Equipment : IPTV WiFi Set Top Box

Brand Name : ARRIS, Bell, Telus

Model Name : VIP6102W

Applicant : ARRIS

101 Tournament Drive, Horsham PA 19044, USA

Manufacturer : ARRIS

101 Tournament Drive, Horsham PA 19044, USA

Standard : 47 CFR FCC Part 15.407

The product was received on May 05, 2018, and testing was started from Jun. 06, 2018 and completed on Jun. 06, 2018. We, SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, would like to declare that the tested sample has been evaluated in accordance with the procedures given in KDB 905462 D02 UNII DFS Compliance Procedures New Rules v02 and shown compliance with the applicable technical standards.

The report must not be used by the client to claim product certification, approval, or endorsement by TAF or any agency of United States government.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, the test report shall not be reproduced except in full.

Approved by: Allen Lin

# FCC DFS Test Report

## Antenna & Bandwidth

| Antenna         | One (TX) |        |        |  |
|-----------------|----------|--------|--------|--|
| Band width Mode | 20 MHz   | 40 MHz | 80 MHz |  |
| IEEE 802.11a    | V        | X      | X      |  |

**Report No.: FZ852415** 

| Antenna         | Four (TX) |        |        |  |
|-----------------|-----------|--------|--------|--|
| Band width Mode | 20 MHz    | 40 MHz | 80 MHz |  |
| IEEE 802.11ac   | V         | V      | V      |  |

IEEE 11ac Spec.

| Protocol         | Number of<br>Transmit Chains (NTX) | Data Rate / MCS |
|------------------|------------------------------------|-----------------|
| 802.11ac (VHT20) | 4                                  | MCS 0-8/Nss1-2  |
| 802.11ac (VHT40) | 4                                  | MCS 0-9/Nss1-2  |
| 802.11ac (VHT80) | 4                                  | MCS 0-9/Nss1-2  |

Note 1: IEEE Std. 802.11ac modulation consists of VHT20, VHT40 and VHT80 (VHT: Very High Throughput). Then EUT support VHT20, VHT40 and VHT80.

Note 2: VHT20, VHT40 and VHT80 use a combination of OFDM-BPSK, QPSK, 16QAM, 64QAM, 256QAM modulation.

Note 3: Modulation modes consist of below configuration:

11a: IEEE 802.11a, VHT20/VHT40/VHT80: IEEE 802.11ac

**Report No.: FZ852415** 

Note 1: The EUT has five antennas.

#### For BT function:

For IEEE 802.15.1 Bluetooth mode (1TX/1RX)

Ant. 5 (port 1) was declared to be tested only by customer.

# For 5GHz function:

For IEEE 802.11 a mode (1TX/1RX)

Support diversity function and pre-tested on each single chain, the worst case was Ant. 1(port 1) and it was record in this test report.

For IEEE 802.11 ac mode (4TX/4RX)

Ant. 1 (port 1) and Ant. 2 (port 2) and Ant. 3 (port 3) and Ant. 4 (port 4) could transmit/receive simultaneously.

#### Note 2:

- The Signals support CDD and correlated, and transmits simultaneously in multiple channels in single or multiple frequency bands.
- If all antennas have the same gain, G<sub>ANT</sub>:
  - Directional gain =  $G_{ANT}$  + 10 log( $N_{ANT}/N_{SS}$ ) dBi, where  $N_{SS}$  = the number of independent spatial streams of data and  $G_{ANT}$  is the antenna gain in dBi. (This formula can also be applied when antennas have different gains if the highest antenna gain is substituted for  $G_{ANT}$ .)
- For power measurements on IEEE 802.11 devices,

Array Gain = 0 dB (i.e., no array gain) for  $N_{ANT} \le 4$ ;

Array Gain = 0 dB (i.e., no array gain) for channel widths  $\geq$  40 MHz for any N<sub>ANT</sub>;

Array Gain = 5 log ( $N_{ANT}/N_{SS}$ ) dB or 3 dB, whichever is less, for 20-MHz channel widths with  $N_{ANT} \ge 5$ .

# 1.1.3 DFS Band Carrier Frequencies

There are three bandwidth systems.

For 20MHz bandwidth systems, use Channel 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140,144

**Report No.: FZ852415** 

For 40MHz bandwidth systems, use Channel 54, 62, 102, 110, 118, 126, 134, 142

For 80MHz bandwidth systems, use Channel 58, 106, 122, 138

| Frequency Band | Channel No. | Frequency | Channel No. | Frequency |
|----------------|-------------|-----------|-------------|-----------|
|                | 52          | 5260 MHz  | 60          | 5300 MHz  |
| 5250~5350 MHz  | 54          | 5270 MHz  | 62          | 5310 MHz  |
| Band 2         | 56          | 5280 MHz  | 64          | 5320 MHz  |
|                | 58          | 5290 MHz  | -           | -         |
|                | 100         | 5500 MHz  | 124         | 5620 MHz  |
|                | 102         | 5510 MHz  | 126         | 5630 MHz  |

# 3 Dynamic Frequency Selection (DFS) Test Result

# 3.1 General DFS Information

#### 3.1.1 DFS Parameters

| Table D.1: DFS requirement values |   |  |  |
|-----------------------------------|---|--|--|
| Parameter Value                   |   |  |  |
| Non-occupancy period              | Minimum 30 minutes  |  |  |
| Channel Availability Check Time   | 60 seconds  |  |  |
| Channel Move Time                 | 10 seconds (Note 1).  |  |  |
| Channel Closing Transmission Time | 200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second periods. (Notes 1 and 2). |  |  |
| U-NII Detection Bandwidth         | Minimum 100% of the 99% power bandwidth (Note 3).   |  |  |

**Report No.: FZ852415** 

Note 1: Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.

Note 2: The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate Channel changes (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

Note 3: During the U-NII Detection Bandwidth detection test, radar type 0 is used and for each frequency step the minimum percentage of detection is 90%. Measurements are performed with no data traffic.

| Table D.2: Interference threshold values |                  |  |  |  |
|--|------------------|--|--|--|
| Maximum Transmit Power                   | Value (see note) |  |  |  |
| EIRP≥200 mW                              | -64 dBm          |  |  |  |
| EIRP < 200 mW and PSD < 10dBm/MHz        | -62 dBm          |  |  |  |
| EIRP < 200 mW and PSD ≥ 10dBm/MHz        | -64 dBm          |  |  |  |

Note 1: This is the level at the input of the receiver assuming a 0 dBi receive antenna.

Note 2: Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.

Note3: EIRP is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911.

# 3.1.2 Applicability of DFS Requirements Prior to Use of a Channel

|                                 | DFS Operational mode |                                |                             |  |
|---------------------------------|----------------------|--------------------------------|-----------------------------|--|
| Requirement                     | Master               | Client without radar detection | Client with radar detection |  |
| Non-Occupancy Period            | Yes                  | Not required (See the note)    | Yes                         |  |
| DFS Detection Threshold         | Yes                  | Not required                   | Yes                         |  |
| Channel Availability Check Time | Yes                  | Not required                   | Not required                |  |
| U-NII Detection Bandwidth       | Yes                  | Not required                   | Yes                         |  |

**Report No.: FZ852415** 

Note:

According to KDB 905462 D03 Client Without DFS New Rules v01r02 (b) 6."An analyzer plot that contains a single 30-minute sweep on the original channel "

# 3.1.3 Applicability of DFS Requirements during Normal Operation

|                                   | DFS Operational mode |                                |                             |  |
|-----------------------------------|----------------------|--------------------------------|-----------------------------|--|
| Requirement                       | Master               | Client without radar detection | Client with radar detection |  |
| DFS Detection Threshold           | Yes                  | Not required                   | Yes                         |  |
| Channel Closing Transmission Time | Yes                  | Yes                            | Yes                         |  |
| Channel Move Time                 | Yes                  | Yes                            | Yes                         |  |
| U-NII Detection Bandwidth         | Yes                  | Not required                   | Yes                         |  |

| Additional requirements for devices with multiple bandwidth modes | Master Device or Client with Radar Detection | Client Without Radar Detection                       |  |
|---|--|--|--|
| U-NII Detection Bandwidth and Statistical Performance Check       | All BW modes must be tested                  | Not required   |  |
| Channel Move Time and Channel Closing Transmission Time           | Test using widest BW mode available          | Test using the widest BW mode available for the link |  |
| All other tests   | Any single BW mode                           | Not required   |  |

**Note:** Frequencies selected for statistical performance check (Section 7.8.4) should include several frequencies within the radar detection bandwidth and frequencies near the edge of the radar detection bandwidth. For 802.11 devices it is suggested to select frequencies in each of the bonded 20 MHz channels and the channel center frequency.

| Aggrega       | Aggregate (Radar Types 1-4) |   |  |  | 120               |

Note 1: Short Pulse Radar Type 0 should be used for the detection bandwidth test, channel move time, and channel closing time tests.

A minimum of 30 unique waveforms are required for each of the short pulse radar types 1 through 4. If more than 30 waveforms are used for short pulse radar types 1 through 4, then each additional waveform must also be unique and not repeated from the previous waveforms. The aggregate is the average of the percentage of successful detections of short pulse radar types 1-4.

#### 3.2.2 Long Pulse Radar Test Waveform

| Radar<br>Type | Pulse<br>Width<br>(µsec) | Chirp<br>Width<br>(MHz) | PRI (µsec) | Number of<br>Pulses<br>per <i>Burst</i> | Number of<br>Bursts | Minimum Percentage of Successful Detection | Minimum<br>Trials |
|---------------|--------------------------|-------------------------|------------|---|---------------------|--|-------------------|
| 5             | 50-100                   | 5-20                    | 1000-2000  | 1-3                                     | 8-20                | 80%  | 30                |

Each waveform is defined as follows:

- The transmission period for the Long Pulse Radar test signal is 12 seconds.
- There are a total of 8 to 20 Bursts in the 12 second period, with the number of Bursts being randomly chosen. This number is Burst Count.
- Each Burst consists of 1 to 3 pulses, with the number of pulses being randomly chosen. Each Burst within the 12 second sequence may have a different number of pulses.
- The pulse width is between 50 and 100 microseconds, with the pulse width being randomly chosen. Each pulse within a Burst will have the same pulse width. Pulses in different Bursts may have different pulse widths.
- Each pulse has a linear FM chirp between 5 and 20 MHz, with the chirp width being randomly chosen. Each pulse within a transmission period will have the same chirp width. The chirp is centered on the pulse. For example, with a radar frequency of 5300 MHz and a 20 MHz chirped signal, the chirp starts at 5290 MHz and

TEL: 886-3-327-3456 Page Number : 15 of 27 FAX: 886-3-327-0973 Issued Date : Jun. 20, 2018

Report Template No.: HE1-D2 Ver2.1 Report Version : 01

- ends at 5310 MHz.
- If more than one pulse is present in a Burst, the time between the pulses will be between 1000 and 2000 microseconds, with the time being randomly chosen. If three pulses are present in a Burst, the time between the first and second pulses is chosen independently of the time between the second and third pulses.
- The 12 second transmission period is divided into even intervals. The number of intervals is equal to Burst Count. Each interval is of length (12,000,000 / Burst Count) microseconds. Each interval contains one Burst. The start time for the Burst, relative to the beginning of the interval, is between 1 and [(12,000,000 / Burst Count) (Total Burst Length) + (One Random PRI Interval)] microseconds, with the start time being randomly chosen. The step interval for the start time is 1 microsecond. The start time for each Burst is chosen independently.

# 3.2.3 Frequency Hopping Radar Test Waveform

| Radar<br>Type | Pulse<br>Width<br>(µsec) | PRI<br>(µsec) | Pulses<br>per Hop | Hopping<br>Rate (kHz) | Hopping<br>Sequence<br>Length (ms) | Minimum<br>Percentage of<br>Successful<br>Detection | Minimum<br>Trials |
|---------------|--------------------------|---------------|-------------------|-----------------------|------------------------------------|---|-------------------|
| 6             | 1                        | 333           | 9                 | 0.333                 | 300                                | 70%   | 30                |

The FCC Type 6 waveform uses a static waveform with 100 bursts in the instruments ARB. In addition, the RF list mode is operated with a list containing 100 frequencies from a randomly generated list and it had be ensured that at least one of the random frequencies falls into the UNII Detection Bandwidth of the DUT. Each burst from the waveform file initiates a trigger pulse at the beginning that switches the RF list from one item to the next one.

## 3.2.4 DFS Threshold Level

| DFS Threshold Level  |     |     |                          |  |  |  |
|--|-----|-----|--------------------------|--|--|--|
| DFS Threshold level:   | -63 | dBm | at the antenna connector |  |  |  |
|  |     |     | in front of the antenna  |  |  |  |
| The Interference <b>Radar Detection Threshold Level</b> is is $-64  dBm + 0  [dBi] + 1  dB = -63  dBm$ . That has been taken into account the output power range and antenna gain. |     |     |                          |  |  |  |

3.3 In-service Monitoring

# 3.3.1 In-service Monitoring Limit

| In-service Monitoring Limit       |   |  |
|-----------------------------------|---|--|
| Channel Move Time                 | 10 sec  |  |
| Channel Closing Transmission Time | 200 ms + an aggregate of 60 ms over remaining 10 sec periods. |  |
| Non-occupancy period              | Minimum 30 minutes  |  |

**Report No.: FZ852415** 

# 3.3.2 Measuring Instruments

Refer a test equipment and calibration data table in this test report.

### 3.3.3 Test Procedures

#### **Test Method**

- ✓ Verified during In-Service Monitoring; Channel Closing Transmission Time, Channel Move Time. Client Device will associate with the EUT. Observe the transmissions of the EUT at the end of the radar Burst on the Operating Channel for duration greater than 10 seconds. Measure and record the transmissions from the EUT during the observation time (Channel Move Time). Compare the Channel Move Time and Channel Closing Transmission Time limits.
- ✓ Verified during In-Service Monitoring; Channel Closing Transmission Time, Channel Move Time. One 12 sec plot needs to be reported for the Short Pulse Radar Types 0. And zoom-in a 60 ms plot verified channel closing time for the aggregate transmission time starting from 200ms after the end of the radar signal to the completion of the channel move.
- ── Verified during In-Service Monitoring; Non-Occupancy Period. Client Device will associate with the EUT. Observe the transmissions of the EUT at the end of the radar Burst on the Operating Channel for duration greater than 10 seconds. Measure and record the transmissions from the EUT during the observation time (Non-Occupancy Period). Compare the Non-Occupancy Period limits.

## 3.3.4 Test Result of In-service Monitoring

Modulation Mode: 802.11ac (VHT80)

| Barranatar                                    | Test Result | Limit    |
|---|-------------|----------|
| Parameter                                     | Type 0      | Limit    |
| Test Channel (MHz)                            | 5530 MHz    | -        |
| Channel Move Time (sec.)                      | 0.4995      | < 10s    |
| Channel Closing Transmission Time (ms) (Note) | 0.900       | < 60ms   |
| Non-Occupancy Period (min.)                   | ≥30         | ≥ 30 min |

Note: The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 seconds period. The aggregate duration of control signals will not count quiet periods in between transmissions.
