SUBJECT: Class II Permissive Change for FCC ID AJKPN822-0336 Tuning Procedure

To Whom It May Concern:

The submitted artifact "TPR-901\_Production Tuning Procedure.pdf" contains the production test and tuning requirements for the A2 Transmitter Assembly. The output power test requirements for the A2 Transmitter Assembly are defined as No Less Than (NLT) 390W and No More Than (NMT) 550W. The FAA airspace requirements for the TPR-901 are defined as NLT 125W and NMT 500W. The A2 Transmitter Assembly output power test requirements are higher to compensate for the RF loss that occurs when mating the A2 Transmitter Assembly with the A5 Rear Interconnect. The TIMCO FCC report recorded the TPR-901 output power as 373.3W. This measured output power is within the FAA airspace requirements.

Sincerely,

Laurie Sussman  
Principal Corporate Counsel
